: Does anyone out there have any opinion of the Azden AZ-61 6m handheld?
: I have half an idea to get one...

If you want a six meter FM handheld, you really don't have a choice.
Regarding my AZ-61, my thoughts are:

Pluses:
This unit is built more like a commercial radio than an amateur radio.
The volume and squelch controls have both good range and feel nice.
The seals around the two buttons are almost too good.
It drops to a 100 uA battery save mode, regardless of band activity.
The monitor button also switches you over to the reverse.
The light button turns on the light for about ten seconds.
It has a real man's belt clip.
It seems to go a long time on a battery.
My Yaesu speaker mic works fine with it.
Plenty of audio out, others say mine is fine too.
It's American, gosh dang it!

Minuses:
The user interface absolutely sucks! I've crashed its software twice.
A hard reset leaves weird stuff in some memories I can't seem to clear.
The manual explains the obvious, and leaves the rest to experimentation.
All of my other radios you just pick up and use; boy, not this one!
VFO mode is good only for plain vanilla simplex operation.
The only battery available is a 12V 600mA that is compatible with nothing.
The only battery charger available is its geeky "five hour" stand.
The light doesn't light the keypad.
It doesn't have DTMF memories.

In summary:
This radio is fine for me because all I wanted is something durable
that goes a long time on a battery for working my repeater and an
occasional chat on 52.525, but don't expect this unit to be an Icom,
Yaesu, or a Kenwood.

Cheers -- Mark

4. Icom service

Newsgroup: rec.radio.amateur.equipment
Date: 1995-08-01 00:00:00 UTC
From: "James A. Storm" <jastorm@ix.netcom.com>
Message-ID: <3vksrk$q4l@ixnews5.ix.netcom.com>
Source record: 214305

I recently sent an Icom W21AT HT for service. Most of the problems were due to many hours of carrying it on my belt. A missing PTT button, TTP worn to where it couldn't be read and some buttons that no longer worked, screws missing, etc. They replaced the TTP, replaced the missing screws, replaced the PTT button, and checked all other things like power out, deviation, audio, etc. They were nice enough to send me an estimate via email as I had requested, which expedited the repair and return of the radio. The total cost was less than the cost of a single battery for the radio, of which I have two. Oh, and they cleaned the whole thing inside and out.

I have to compliment Icom factory service. They did a nice job and I now have a radio that looks and works like new.

5. Free Ham Radio Test Simulators - Macintosh

Newsgroup: rec.radio.amateur.equipment
Date: 1995-08-01 00:00:00 UTC
From: john@wd1v.mv.com
Message-ID: <john-0108950603120001@wd1v.mv.com>
Source record: 214306

The new Macintosh Ham Test Simulators are HERE!

Novice Ham Test 5.0 SA.sea
Technician Ham Test 5.0 SA.sea
General Ham Test 5.0 SA.sea
Advanced Ham Test 5.0 SA.sea
Extra Ham Test 5.0 SA.sea

The latest versions feature:

HyperCard 2.3 as a stand-alone application (SA) eliminating
the need to have HyperCard. All you need is a Mac with 4
Meg of memory and version System 7 or greater.

Each version 5 Ham Test Simulator has the latest questions
as prepared by the Question Pool Committee.

Each Ham Test Simulator is FREE OF CHARGE and work the
same way as the originals written by Diana, KC1SP.

You may obtain a Ham Test Simulator by mailing me a *FORMATTED
disk (1 per test) and include a Self Addressed and Stamped disk
mailer for the return.

Each Ham Test Simulator is also bundled with a shareware CW
program called MacMorse 1.4 written by Doug, WB0EON.

Also included are a collection of text files that relate an
interesting variety of ideas about the best way to study CW and
prepare for tests.

If you load these onto file servers where others can gain access
via Internet, please let me know so we can point others in that
direction.

Your comments and suggestions for future versions are always
welcome. Stay in touch and good luck with your next test!

73,

>: I have half an idea to get one...

I won't duplicate Mark's, KM6XU thoughtful append, but I agree with him down the line. I would add that what Azden apparently did was modify their 2m handheld for 6m use, but not completely :-(Thus, you find things like the standard repeater offset at 600Kz, which on 6m is totally worthless, and not changeable. Thus, you have to program in both the rx and tx frequencies into memory. Programming this thing took forever to learn, and I'm still not quite sure that I understand the parameters for entering frequencies because I can't verbally describe it (something like you have to enter the Mz first, save it, and then continue to the Kz..although I can do it so I must understand it at some level). Also, at 5W, this thing gets hot! According to Azden (I called), the belt clip is the heat sink. Go figure.

On the other hand, performance has been excellent. I have had excellent signal and audio reports with it. A few people couldn't believe I was on a handheld with a ducky (peculiarities of 6m propagation nothwithstanding). And as Mark suggested, it is built very well.

So, overall, I give it an A for performance, A for construction, C+ for features, F for ease of use. If you can overlook the ease of use problems, it's worth buying.

So are you using a telescoping antenna now? If so, what kind. I've been
so happy with the performance of my "Hot Rod" from AEA that I never even
thought to put it on my SWR meter. Since the performance was so good, I
assumed the SWR was sufficiently low. I now plan to check it out real
soon.

Yep! Sent it back and got my money back. (Which they did without
complaint I might add.)

The audio was way too low according to my friends and I had to
turn the radio way up to hear. This was at idle on a BMW K75T.
(I can't imagine what it would be like on a Harley!)

I am still looking though for a solution.

If you have read any reviews on both the TS-850SAT and the IC-736 I would like to hear about them. I have talked to a few EME'er and found out that they like the TS-850SAT for moonbounce work. I will do more HF work than EME for the next few months since I am just starting to build a EME station. Please send your opinions on the two rigs. If you feel that another HF rig would be better, let me know this too.

Thanks for the help

16. 2m radio advice sought...

Message-ID: <3vlp28$biq@vixen.cso.uiuc.edu>
Source record: 214317

Sorry if this has been covered before but I'm new to ham radio having only just received my tech+ license.

I'm interested in buying a 2m hand-held radio but I'm not real sure about what type of features I should look for and what brands are the best value. I absolutely can not afford radios with all the bells and whistles and am only interested in the low end in terms of price.

If you had $300 to spend on a 2m radio, which would you buy and why?

Thanks.

No, the change wasn't to the firmware. Milt has the correct answer,
the RF hardware to do 800 MHz was left off the input interface board,
that's the little tiny board next to the BNC. The different numbers on the
digital bits just represent different vendor codes for the same parts.

>I just ordered an mobil antenna with a Larson Trunk lip. It comes with 17'
>feet of RG58. I only need it to be about 4-5. Sould I cut off the excess?

Larsen offers their mounts with two different kinds of cable. One is
just high grade RG-58, and the other uses a cable that *looks* like
RG-58 but has much lower loss. The packaging indicates whether you
have the regular mount or the one with the special low loss cable
(the price reflects the different cables too!).

Anyway, regardless of which one you have, *if* you have the *correct*
connector for that cable, *and* you know how to install it properly,
then sure, cut the cable to length. If you install the connector poorly,
you can easily have more loss there than you'd save by shortening the
cable. We normally have to cut the connector off anyway to route the
cable properly, so shortening the cable is the normal thing to do.
There's nothing magic about the supplied length. I really don't know
why Larsen bothers to attach a connector we're going to cut off anyway.
Seems like they could just include a loose connector in the package
and let us install it ourselves after we have the cable routed.

First and foremost, there is no excuse for shabby treatment of a customer.
But I *can* forgive salespeople for ignoring a known browser and non-buyer.

But it's easy to see how a bad attitude can develop:

> As a class, hams are among the cheapest bunch I've seen.

I'll second that. It's amazing how many times the word "cheap" starts
or finishes a phrase in this group. It's not wrong to want to save
some money, but there are other considerations.

> Once he helps some hopeless moron "pick out a radio" for 45 minutes,
> the guy will hang up and shop for best price.

I have a friend who owns a retail store in a non-ham business. He used
to have a fairly liberal "try-before-you-buy" policy, but he discovered
that what was happening was that the morons would use the equipment for
a few days, return it, say thank you, and then go order it through a
mail-order outfit.

He used to carry related magazines, but the morons would come in and talk
to him for an hour about equipment, then go over to the magazine rack,
look up a mail-order ad, and say "I'll pay that price and no more."

Of course, they don't think they're morons; they think they're clever
shoppers - but then, being morons, they're hardly in a position to
define "clever".

Personally, I haven't bought *any* ham gear mail order. I support a
local retailer who gives me advice, gives me service, charges a fair
price, and keeps me happy. I don't mind buying mail order when I know
exactly what I want and don't need advice, but if you like the service
your local retailer provides, you'd better give him your business so
he'll still be there the next time you need help.

> expect to get must resale value on it.

Here's my opinion as a JRC (as well Kenwood,
Icom, Yaesu, etc.) dealer...

Without attempting to figure out what you mean when you say
"orpan rig," let me just add that the JRC receivers (NRD-515,
NRD-525 and NRD-535) are among the BEST in terms of holding
their value. The JST-245 should be no exception.

If you are suggesting that JRC may fold up and leave owners
hanging, consider that JRC has been in business since 1915.

Just my 2 cents worth... :-)

Best 73!

21. GE MASTR II Repeater (help CG Tone board

Newsgroup: rec.radio.amateur.equipment
Date: 1995-08-01 00:00:00 UTC
From: MKWS78A@prodigy.com
Message-ID: <3vm13n$2fp4@usenetp1.news.prodigy.com>
Source record: 214322

I could use some help converting a GE mastrII into a repeater.

I need help in the channel guard tone board.
mine is a encode and decode board. has a # PL19D4172G1G1 REV D
on the metal cover over the versatone element. The decoder #
is 19D416730GI and encode is 19D416740G2

I need the mod that keeps the RX decoder from being disabled
when the radio goes into transmit.

I saw one that said cut the top lead of CR1009 which is supposed to
be mounted vertically on the deck. I couldn't find it.

Another mod says cut two circuit runs at j908 pin 8
delay PTT on the receiver CTCSS board. I can not find two circuit
runs on my channel guard board there.

Any help appreciated, Bill

If you're talking about a Motorola Radius P50, then yes, they are rather old. They have been replaced by the SP50. The P50 is a two channel version of a P10 (both radios are crystal controlled). Around here, a used P10 goes for about $75, so I would guess that a P50 goes for about $100 - $125 used. There are fairly reliable radios and can take a bit of abuse. I would suggest that you get them with PL or DPL tone boards, they seem to get more sensetive to inteference the older they get.

In a message dated 07-31-95, glyle@io.seas.ucla.edu said to All:

glyle>As far as telescoping antennas go, I tried a AEA "hot rod" antenna. It
glyle>seemed to work better than the Icom rubber antenna, but when I hooked it
glyle>to my SWR analyzer I couldn't get the meter to unpin (swr 3:1++) anywhere
glyle>on the ham band. The Hotrod now resides in the junk drawer.

George, I'd say you own a broken Hotrod! Mine shows a 1.2:1 SWR right in
middle of two meters. It's a great portable antenna, I wouldn't own a
2M HT without one.

|> PTT and too earphone weak for anything above 30 mph.

I use a standard Icom mini speaker mike inside the chin bar of my helmet.
A "flat" PC style speaker easily fits in the ear recess and plugs into the
bottom of the mic with a short wire.
I use an inline PTT switch between the speaker mic wire and the radio
(a W2A).

I had intended to disassemble the speaker mic and install the parts in my
helmet, but it works so well as it is that I never did it!

I have built helmet setups for CB radios on Goldwings using the standard
parts from the mics that came from the radio. Other than having to put
a 100pF cap across the mic to shunt RF they go together very nicely, A
good helmet setup is well worth the effort.

No, I now use a "long rubber" antenna as offered by Comet.

I may be overreacting on the SWR issue as HTs are very tolerant of mismatches. Since there is no feed line involved, most of the RF finds its way out regardless of the match. The rubber antennas that come with the HTs are't too well matched in many cases!

Also beware of overstressing the BNC connector on the HT!

>(the price reflects the different cables too!).

The Larson mount I bought last year also came in a "flavor" that had *no* cable attached... and I added my own super low-loss cable. Picked up a measured 1.5 dB on 440 over the same mount with the standard RG-58 they supply.

BTW, it's one thing to cut off the excess cable but don't cut it *too* short. Measure what you need then give yourself a extra foot or two or three. ... you never know when you might need it..

For serious DXing the Paragon II has it all over the original Paragon.
For casual hamming with a good measure of SWLing the original will
work fine.

The II has superior cross mod figures, sharper filters, faster
switching for Pactor and Gtor, and quite a few other advances.

I have used both and the II is on my list of items to acquire in the
not too distant future! Am really impressed with it. I have a shack
full of Kenwoods and classic Collins and Drake gear (am a collector)
and the Paragon II would take top honors in all catagories. Even
beating out my R8A.

Source record: 214332

alik@sw.ru (Oleg V. Melnikov) wrote:
>What type of emission (modulation) means ?
>For example 16K0F3E ?

F3E is analog FM

The 16K0 in front of it is the way the FCC designates the neccesary bandwidth of a licensed channel (I beleive this is IAW with ITU standards). 16K0F3E is an FM channel, 16 KHz wide. If (for some reason) the channel was licensed for 16.5 KHz it would read 16K5F3E. Most of our PLMR channels are 16K0F3E or 20K0F3E. Our aviation channels are 6K0A3E or AM with 6KHz bandwidth. Some our HF channels are 2K80J3E or 2.8 KHz SSB.

The "K" replaces the decimal point to designate bandwidth and indcates KHz. Hz would be shown with an "H". Mhz would be shown with an "M". GHz would be a "G".

37. Whats a good beginner HF radio?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-08-01 00:00:00 UTC
From: hmm@netcom.com
Message-ID: <hmm-0108951847270001@192.0.2.1>
Source record: 214338

I am interested in getting an HF radio.
I have my tech plus and am working on my general.

My biggest issue is MONEY.

I have seen an HF radio advertised for $549 that puts out 50 watts, and
has modules for 30 bucks a piece for the different bands.
This isnt bad.

Other than that, the cheapest ive seen is around 800 bucks for an
160-10 radio.

I dont really like the idea of buying used because alot of times you dont
know what your getting.

There are kits through ramsey, and a couple other companies (MFJ?) that
are low power, and only a single band, but I dont know if these are any
good.

Does anyone have any suggestions?

Any replies are greatly appriciated!

Thanks!

>Bill Childers
>KE6VVW

There is a mod to open the transmit frequency, Bill. You must remove a tiny component the size of
half the head of a pin. I modified mine because as it comes it excludes a portion of the 70cm amateur band.

Rumor has it there may be a receive mod, too, but I haven't heard anything about it. and haven't
looked since I own a scanner that is 100 times better than the best HT on non-ham freequencies. I
just don't care much about listening there.

Be advised... the stock antenna works very well inside the ham bands. Even an excursion to tthe
162.55 WX frequency leaves it sadly lacking. The local WWX station is barely audible with my 508,
yet with another antenna... full scale.

Ed

H>so I've got a question. are people looking forward to the ICOM 706 to use
H>more as a mobile or base station unit?

I think it's the only way I could get 2 meter and HF in my Toyota. No
room for 2 radios, unless I do some serious remodeling of the dash. I
don't want to do that because I want to be able to take it out and stick
in on the four wheeler :)

Any idea on the cost of this rig, or what Kenwood is going to come up
with to compete?

I am a high school student and know where you are coming from on the
money. I would suggest going with say one of Kenwoods older models. I
got a TS-430S for $425 and a friend of mine found on with factory power
supply for $400. It has all bands, 100 watts, and I resently took mine
on vacation to colorado and had no problems taking it mobile..
Just something to think about.

rg-58 will work on 2m, however, in most cases it would be wise to get
better coax.. I use some rg-58 to make short connections and for portable
antennas. I even have some on a 5 element beam on my roof however there
is only about a 25 foot run of it. I was reading last night and it seems
like rg-58 is approx 5db loss per 100 feet.. In other words.. if you put
100 watts into a 100 foot run, you'd be getting something around 30 watts
out at the other end.. For short runs, 58 is fine but you should
seriously consider some RG-213 or 9913 for runs over 20-30 feet.

>KD4IHG
I have several antennas I have for my DJ-G1T. It is a mono band HT on
2m. I have the factory rubber attenuator that I seldom you except for
short simplex jumps. I also have a flexable 1/4 wave antenna.. it
preforms much better than the default but for the repeater use (all of
the repeaters are quite a ways away from me) I have an AEA Hot Rod
antenna... I think I payed about $20 or $25 for mine from a mail order
source...It is a telescoping 1/2 wave when extended and claims to be
equivilant to a rubber ducky in the collapsed postition. One time I had
stuck the HT in my pocket with the Hot Rod on and got it snagged on the
door of the van. It broke a plastic piece on the inside of the antenna.
We tried fixing with included tearing off some heat shrink and pulling
everything apart. After discovering that we couldn't fix it, I called
AEA. They told me to put it in a bag and send it to them. I did and
they sent me a brand new antenna within a couple of weeks.

For what it's worth, I ordered some items from AES Milwaukee last Friday (they haven't yet arrived, but that's probably because UPS hasn't arrived at my building yet) and spoke for a bit with the gentleman on the other side of the phone. He said that:

a) There are AES employees watching this discussion
b) There have been memos sent out *and*
c) He personally was watching himself carefully. I don't remember his name; he was very polite.

The upshot being: at least AES knows about the problem, and is going to make at least a token effort to fix it.

I know that HRO employees are on the net. Has anyone called up HRO to order anything recently and asked them about it?

I also know that Radio City is on the net, but I haven't seen many complaints about them.

55. ### Communications in moutains?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-08-01 00:00:00 UTC
From: 93102208@comet.np.ac.sg
Message-ID: <3vjvca$avg@comet.np.ac.sg>
Source record: 214442
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.antenna

Just the other day when i was out, a guy who was into rock climbing was asking me to suggest the kind of communications gear they could carry whislt mountain climbing.

He was interested in 2 types:

a) Handhelds which would allow him to communicate with the rest of the group (of which, they could be on the 'other side' of the mountain, or the other side of a hill/ridge/etc) - and he was worried that 2m or 70cm will not have a 'line of sight'. Is this a valid worry? What are his alternatives?
b) HF communications. For DX work. I presume they'd like to make contacts when they reach the top. Would be a fun thing to do. They'd have the advantage of height. What kind of transceiver would one recommend them to carry along (QRP?), they'd also like suggestions for antennas. I guess a keyword here would be lightweight, and easily errected.
(Also, perhaps the same setup could be used whilst climbing - perhaps to establish a regular contact, or to let others know their location, and maybe summon help if required...)

They are -not- licenced amateurs yet, and would like to know if they could use amateur bands for thier purporse if they got licenced. (I told them yes, since they were climbing for fun, and not a business, and they don't make money out of it (then i gave them the idea for working dx)). I just want to double check I didn't give them any wrong info.

Of course, I understand they'd have to apply for a recipocal licence in the country they are climbing before they can use their rigs.

I guess I'm just asking, what would one recommend for communications in 'mountain' terrain? Preferably lightweight, and can be errected/dismantled without too much hassle, and if possible, quickly.

Thanks for all followups.

Edwin, 9V1ZY.

56. Alinco Handhelds

I really don't want to pay the price for a new Alinco. I really
like their products. Does anyone have an Alinco DJ-580T for sale at
a decent price? I have an RS HTX-202 that I will use for packet but
like to own an Alinco for a walk around.

I am also considering to switching to a Kenwood TH-78A. Does anyone have
a good deal for me?
Thanks and 73's,

Chris

57. Drake TR-6 AM Filter?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-08-01 00:00:00 UTC
From: jds@neptune.net
Message-ID: <3vkar7$sgo@neptune.neptune.net>
Source record: 214444

After a cleanup and inspection, I put my recently-acquired Drake TR-6 on the air yesterday morning on a local 6m AM net. Had a great time!

But, after walking the VFO back and forth trying to tune in each station in USB mode, I was thinking that maybe life would be easier with a proper AM filter installed.

The TR-6 manual says that the USB filter is 2.4KHz bandwidth, while the AM filter is 6KHz BW. Seems like that might help my tuning around a little...

I have since learned of an apparent 'trick' with the TR-6, of installing a 270 ohm resistor in the filter slot. I will try that next time I can check in to the net.

Otherwise, I can only hope there is a homeless filter out there somewhere. Or, any pointer on constructing or adapting a filter appropriate to the radio (would prefer no op amps, but if I must...;-) would be gratefully accepted!

In the meantime, I'll be perusing old Handbooks for AM filter designs. And, I'll be checking into the USB net tomorrow night!-)

Thanks for reading.

Well as far a HRO goes, in one of their stores they had to move all their Repeater Pocket books behind the counter because too many of those small pocket books were being stolen (must be those scanner people - hihi).

The point is that there more sides to the story then that being given here.
In fact the best thing an AES or HRO person could do that reads this thread
is to say nothing, else he/she would be a target.

I was born in Milwaukee and can remember when AES was the place to go for ANY electronic needs, TVs, Microwaves, parts, etc. When I get back in town and go to their Good Hope Road store I have ALWAYS been treated right. Yes the phones are ring, they of course do a great deal of mail order.
But I was always waited on without major delay, and once a saleman started to wait on me, he stayed with me till I was done. What more could someone want?

HRO in Virginia has treated me the same. In fact the guys behind the counter hear about how well my dog was trained that they asked me to bring her in and "DEMO" to then a well trained dog. Now that's down right personable. Again, what more could someone want? If you want to be a pen-pale to an AES or HRO sales guy, catch them on packet!!!

Regards,
Horrock

Source record: 214354

I drive a '90 Ranger with the straight-4 and you won't have any problems on uhf/vhf but on HF you'll have to put in some sweat equity.

I ordered the Ford fuel pump noise kit and installed it. It isn't hard to do, actually- you just remove the cargo bed from the truck. No foolin', it's easy, you remove those six large bolts from the floor, disconnect the fuel filler hose and light cables and lift it off. Unfortunately the Ford suppressor kit gives a substantial improvement on 15 meters and the higher bands but less on 20 and the noise is about S8 on 40 and the lower bands.

Ultimately I used radical surgery. I bought a sheet of copper screen at Skycraft in Orlando which I have used to enclose the fuel pump in an RF-tight shield. I formed it into a stocking shape, slipped it over the fuel pump and inlet screen, soldered it along one side and attached copper braid from a .242 size coax. This runs out through the "lid" of the fuel pump assy (you must maintain the vapor-tight seal) and grounded to the frame rail. Also, you must make sure that the screen does not interfere with the float sender.

For me, this gave about -24 to -26dB reduction of noise on the low bands. I also established a local ground for the pump (the harness ground return is at least 1 meter long). Obviously this repair is only for plastic-tanked vehicles. It is the direct EM radiation from the pump which is impinging on your antenna that is causing the problem, rather than troubles of noise getting into the various leads and cables in the vehicle.

: in Portland (Tigard), Oregon. Several instances have occurred
: but the one I remember was wanting to look at the new Icom handheld.

Having heard experiences from AES outlets and HRO and a few others;Anyone had any dealings with JUN's Electronics in Culver City ? certaing sales man have been helpful in answering my questions as I come and go and not buy much. One exception is the Sales mgr their that doesnt seem to be friendly .. bad day maybe ?

Well I did finally buy a HT with accessories at ICOM day and a a good deal as well. This happened months of just coming and going. I have bought accessories like antennas , batterries , etc . The Ht was a MAJOR purchase.

My 2 cents thrown in..... having heard about the other Ham dealers I couldnt resist adding JUN's to the growing list.

70. ROTOR - Channel master - old tv salvage

Newsgroup: rec.radio.amateur.equipment
Date: 1995-08-02 00:00:00 UTC
From: dan drumm <drumm>
Message-ID: <3vonnm$3ho@koala.uwec.edu>
Source record: 214358
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.homebrew,rec.radio.amateur.misc,rec.radio.amateur.equipment

Ground score!
I found an antenna rotor, but have little not no info.

Does anyone have/use/know about the channel master crown. I got
it from someone who was reroofing --complete with tripod for the
roof, but I do not have the controler, and I do not even know the
voltage it needs (my guess is 12v). All I can see are the three
wires used to control it.

It is real old, but fits nicely into me new budget; it was free.

..any help or references appreciated.

Dan Drumm
N9VOX (general is comming real soon now, but I like this call!)

From: davros@news.eden.com
Message-ID: <3vnm0v$cbm@matrix.eden.com>
Source record: 214360

It's best to earse the DTMF memory and start over. In fact, that, to my knowledge, is the only way you can delete too-long numbers. You earse like this...and it ain't in the manual. I only found it out of desperation and frustration and trying every silly thing I could think of:

1) Select the DTMF memory you want to change.
2) Go into program mode (hold down the F/M button for a half second, like you're going to enter a new phone number.)
3) Press the..um..what is it? button. It's the one right above the on button and below the monitor button. It changes control of the radio from the primary to the sub band.
4) Press the call button like you're going to save the contents of the DTMF memory.
5) Reprogram the memory as usual.

I don't know why that isn't in the manual, but it isn't. It does work, however. (By the way, with beeps on, when you press the...what do you call it...button, you'll hear a high-pitched beep.

Hope this helps.

>BTW: I bet your dog is bigger than mine...and that you can run
>faster, jump higher, and leap tall buildings better than I can. Gosh,
>Superman it sure is nice to meet you here on the net.

>Jim Martin, WK1V

Well, I don't know about your dog, nor your speed in the hurtles. I do not claim to be Superman because we already have one in Washington (Newt). I was merely relating an experience that I have had with the '530s that I have been able to test. I do not do 12DB SINAD tests because I don't want to bother with hooking all the stuff up. My communications analyzer will generate signals about anywhere and allow me to vary the output. I test the radio by generating a signal at 146.55000 mhz and injecting it into the antenna jack. This tests the receiver sensitivity from the very top of the chain. Then I start reducing the output and read on the CRT where the radio loses the test signal in microvolts (squelch off).
The '530s lost the signal at 2.71uV whereas the '11R did not ever lose the signal, the generator would only go down to .03uV. That is the result of the tests I did on the radios I had, of course your mileage may vary. Now if that means my dog is bigger than yours...I can run faster than you..etc.. then I have the number of a shrink that you can see about your inferiority complex.

Get the FT51R. Nicer radio, more "bells and whistles" but by all means,
if you have a Windows based computer get the programing software for the
HT. Makes it so easy to program and reconfigure.

In short great radio.

Source record: 214366

M740166%SLVMA.PRofs@mdcgwy.mdc.COM wrote:

: Fred, KE0ZG, wrote asking if anyone had a word of wisdom on
: the JRC JST-245 HF/6 meter transceiver.

: Here is my words of wisdom:
: I think that 'any' rig produced now is very good. The equipment
: of the 90's are all first rate when compared to the stuff
: in the 70's.

Some of the latest model HF radios may look hellishly impressive, but you really have to try some serious measurements to see what they can actually DO. There is still a spread from good to junk. As for the 70's, there was certainly some junk, but there were some rigs that can still hold their own with many current radios in terms of ability to communicate, though they lose badly in the flashing lights and memories stakes. From the late 70's early 80's there are the TR7 and Corsair for starters.

On-air evaluation is often misleading as HF conditions are famously variable, yet people don't make allowances. The difference between open and closed bands is far larger than the difference between good and mediocre radios

: But when you buy an 'Orphan' rig like the JRC, don't
: expect to get must resale value on it. My experence is to stay
: with the main stream manufactures, Icom, Kenwood, Ten-Tec or
: Yaesu.

JRC have been on the go from early this century, they are proud of it. They are one of the successful manufacturers of professional comms and navigation equipment. They have a good reputation for quality, and are proud of it too. Try buying one of their receivers second hand and you will discover two difficulties: 1) the prices are high 2) Few people with them want to sell them.

Those "Orphans" are still with their families, and their ancestors go back a lot further than most other brands.

: I know the ad's look good, I bought a Yaesu FTdx560 transceiver
: from Spectronics (this is before Yaesu America came in) and I had all
: kinds of troubles with service, parts and sold it for nothing just
: to get rid of it.

I'm not surprised. Adverts are always carefully designed to look good, but some of the radios advertised have been real lemons. Someone was offended only a few weeks ago when I point blank refused to even

look at an FTdx400. If it had been someone just getting going in the hobby, and it had been all they could find that they could afford, I'd have done a lot to sort it out for them. I fix radios for fun, for friends and members of the local club. I do it for free so I reserve the right to avoid bottomless pits unless I feel charitable considerations are more important.

: Wonder how many KDK 2 meters transceivers are
: still out there without serivce.

Here in Britain, there are a few KDK's. I've had a couple apart. No chance at all of decent service info, and usually the owner's handbook postage stamp sized diagram is long lost. Their circuitry is a bit, well, let's just say "Odd" in design. There are also "Standard" 2 metre sets around, but service info and spares are hard to get for this make. As you rightly suggest, the resale prices are rock bottom. Of course, someone with a reasonable background in amateur radio ought to be able to open one up and find their way around without much service info, and make a good attempt at fixing many faults with generally available parts. All bets are off when custom parts like microcontrollers are dead, of course.

: Those are my 'words', any other opinion's?

I think your concerns are important ones, Joe, though I'd personally be less worried about JRC than the "Big-3". JRC haven't been a big player in amateur transceiver circles (though they are the brand leader in HF receivers in, at least, my part of the world) so I suspect a lot of people are unaware of their size, history or reputation. Although I don't own any JRC equipment, I'd be happy enough to do so.

As I seem to have been 100% nice to JRC, now might be the time to point out that I've seen a good number of their receivers where the tuning knob shaft bearing showed a lot of wear after heavy usage. OK, the radios still work fine, but, perhaps ball races would be better?

Cheers
David

In article <3vo47t$22q@ixnews4.ix.netcom.com> longtran@ix.netcom.com
(Long A. Tran) writes:
>I'm planning to get a dual band mobile radio. Any recommendations
>will be appreciated.

Well, I don't have any reccomendation, but I will share my experience
with dualband mobiles.

I have owned a Yaesu FT-5200, and a Kenwood TM-732. Here are my impressions
of both:

YAESU FT-5200 - Positive:
1. Nice receiver implementation. Significantly less intermod than the
Kenwood or (heaven forbid) an HT.
2. Remote mount head quick releases. Which means that I can detach the
control head/mic and stash it in my glove box when parked.
3. Built in duplexer. I use a dualband antenna, so this saved me ~$30
on buying a duplexer.
4. Simple user interface.

YAESU FT-5200 - Negative:
1. Intermod. Even though it is better than the Kenwood, I still felt the
need for a CTCSS (PL) decoder, a $60(?) option.
2. Few memories. I am spoiled on having enough memories to program all the
channels I *might* be interested in. With the Yaesu, that is not possible
(16 memories/band, I think).
3. No DTMF memories.
4. Can't switch bands from the mic. This is a nit, but it's something I'd
really gotten used to on the Kenwood.
5. No AM aircraft receive.
6. A general lack of bells and whistles. Few scan modes, no memory
reconfiguration, etc.

KENWOOD TM-732 - Positive
1. Wealth of nice features: scan modes, memory reconfiguration, mic
accessable features, DTMF memories, etc.
2. Plenty of memories. In my configuration I have about 70 memories total.
3. Excellent audio quality.

KENWOOD TM-732 - Negative
1. Intermod. Squelch breaks sometimes due to intermod even *with* CTCSS
decode turned on.
2. Very difficult user interface. Many overloaded keys, hidden functions,
cryptic indications, etc.
3. No built in duplexer.
4. Some reliability concerns. My rig had an open ground to the Mic, very

difficult to diagnose. My rig is also experiencing some receive feedback when the unit is very hot (>120 degrees F, I'd say).
5. Poor reputation Kenwood service. I have heard enough bad things about Kenwood service to make me afraid to send it to them. I use a local ham (hi Lew) for my repair work.
6. Nondetachable remote head mount. The control head is remote mountable, but once mounted, requires a screwdriver and a tiny electrical disconnect to remove. Not practical to remove for security purposes.
7. Non backlit mic buttons. Not a problem for me, but important to some.

Many of the advantages listed above directly lead to some disadvantages on the same unit. For example, lots of features leads to a bad user interface. Yes, I *do* want to have my cake and eat it too :-).

The bottom line is that when it came time to sell one of the rigs, I put the Kenwood on the market. BUT, when the buyer wanted to switch the deal and buy the Yaesu instead, I agreed.

Despite all the gripes above, I am happy with my Kenwood. The lack of memories on the FT-5200 is almost a fatal flaw, but I was willing to live with that unit, too. Another point is that the rigs *are* different. You will want to find out what the differences are.

As far as making an actual purchase goes, I'd advise you to buy a used unit from packet or rec.radio.swap. You can get a used late model dualbander for ~$500, a swignificant savings from purchasing new. And you will be able to sell the unit later for about the same price.

Hope this helps.

Why Tom!

1) I'm really surprised at the personal attack...that's below your usual
level "of I'm the expert on everything" stance don't you think.

2) Alas you are mis-informed about how I spend "all" my time. Actually I
spend half my time running a very sucessful electronics manufacturing RF
products plant for an OEM serviceing the utilities industry. As far as my
Ham activities go I design and construct low band wire antennas. and
then spend a fair amount of listening time on 160, 80 and 40 cw, where I
have just under 700 band/countries confirmed. That and the honey do's
leave me very little time to "trash" MFJ. In fact looking back seems like
I may have spent less than 10 minutes in the last 6 months on that topic...
On the other hand If you don't wanna know what I think then don't waste
yout time reading it ;-)

Just thought I would add - I love my ACC RC-96 repeater controller. Apparently the company no longer produces them, but it is a sweet controller. The price is a hard nut to crack (1200-1700), but worth the cost if that is the type of controller you are looking for. The autopatch works great. Also at one time I had a kenwood ts-440 hooked up remote base style, also worked great.

>

Mee Tooo,

Those radios are SOLID, too! I have a 735, 229H, and an O-2at. They get beat up regularly. I really abuse those poor radios. Twice they've had to go in, (the 229 and the AT-?? matching tuner for the HF rig). I always get more than I expect at a much lower cost. And if I think to say that I'm in a hurry, they accommodate me!

94. ACC belly up ?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-08-02 00:00:00 UTC
From: william@cortex.ama.ttuhsc.edu
Message-ID: <Pine.SUN.3.91.950802213843.17204A-100000@cortex>
Source record: 214382

Hello all.

I tried to call ACC to order a new AC-96 repeater controller two weeks ago. All I kept getting was an answering machine, and they NEVER returned any calls.

I then sent then an EMail message saying that if the whole company was going on vacation, it would be nice to say when they were getting back so that customers like myself wouldn't get PO'd.

I kept trying for a week, and now I get a message on their answering machine that they are 'exiting the amateur repeater controller business", and thanking everyone for 13 years of support.

So have they gone belly up or what ?

I was convinced that they had an excellent product, and I am surprised that they suddenly went out of business.

Anybody have any info on ACC ?

Thanks,

Reddy Biggs

95. Mod Info for KW TM241A

Newsgroup: rec.radio.amateur.equipment
Date: 1995-08-02 00:00:00 UTC
From: mallorys@nbnet.nb.ca
Message-ID: <950802222632.F75516@news.nbnet.nb.ca>
Source record: 214383

Hello and thanks for reading this posting.

I have the mod for the Kenwood TM241A that will permit me to transmit out of band. (I know, don't transmit out of band, its against the law.) Any way if you are familier with the mod, it says to cut the green jumber wire and install a diode as D209 on the control board. My question is this, where do you install the diode? There are no markings on the control board to indicate where D209 goes. Also does this mod really work, and if so how good or bad does it work?

Any help would be appreciated.

Steve

96. RE:BEST ANTENNA FOR AN HT

Newsgroup: rec.radio.amateur.equipment
Date: 1995-08-03 00:00:00 UTC
From: goodwin@Primenet.Com
Message-ID: <3vrct3$eal@nnrp1.primenet.com>
Source record: 214252

In a message dated 08-03-95, fitr%mimi@magic.itg.ti.co said to All:

fitr%mimi>Remeber the AEA Hotrod is a 5/8 wave antenna meaning
fitr%mimi>that it requires a ground-plane to resonate
fitr%mimi>effectively. Likely, the little HT is hardly a
fitr%mimi>sufficient groundplane hence the 3:1 vswr.

Incorrect. The AEA Hotrod is 1/2 wave, and does not require a
ground plane. And as I said, mine has a 1.2:1 SWR in the middle
of the band.

fitr%mimi>I've found the MFJ "Super Gainer" to be an excellent
fitr%mimi>telescoping antenna. It is a half-wave end-fed
fitr%mimi>antenna meaning it does not require a ground plane to
fitr%mimi>achieve a decent match. It achieves a match via
fitr%mimi>loading coil at the base, but the coil is much
fitr%mimi>tougher than the AEA hotrod. The coil is in a metal
fitr%mimi>sealed can making it very durable, The telescoping
fitr%mimi>whip can unscrew from the coil for replacement (mfj
fitr%mimi>sells them for about 4 bucks). So, if you break it
fitr%mimi>you can fix it. Further, it is a bit shorter than a
fitr%mimi>5/8 wave antenna. Lastly, the power rating is 10 or 15
fitr%mimi>watts making it usable even on some mobile rigs as a
fitr%mimi>"back of the set" antenna. Shortening the whip makes
fitr%mimi>a good antenna throughout the 144-160 Mhz band and
fitr%mimi>I've used it at 154 Mhz with good results.

Sounds nice. How much does MFJ get for the Super Gainer? I generally
try to avoid MFJ gear (let's face it, their QC is non-existent!) but
I have an open mind! I've never had a problem with my Hotrods, but
they do strike me as being kind of fragile. A more durable equivalent
would be welcome.

>Does any out there have a Kenwood TS-700a 2m all mode rig and how do
>you like it?? Comments please.....

What I like about it:
1. VFO uses a variable cap, not synth'ed.
2. AC and DC capable.
3. Mic gains readily accessable (under top panel).
4. It was cheap (<$200).
5. TX switching output is a relay contact, easier to interface with strange
gear.

What I don't like.
1. Not very sensitive RX. I've added a mast-mount preamp, so this
is no longer an issue.
2. Only 10 watts out. (I bought a Ramsey amp kit and I can get 40 watts).
3. Can't do split VFO operation, unless you use a crystal instead of VFO 2.
4. It's kinda big'n'heavy.
5. Doing CTCSS tones looks like major surgery, but I don't use it for FM.
6. VFO scale is hard to be precise with, but no one ever operates on the
same freq as anybody else.

All in all, I think it was one of my better radio investments. You can get the
Ramsey 2m preamp and build it in to the rig (where I started), and it works
almost as well as a mast-mount preamp.

It's not worth more than $200, even if it's been in the box for 15 years ;-).

100. Alinco DJ-582T as first HT

Newsgroup: rec.radio.amateur.equipment
Date: 1995-08-03 00:00:00 UTC
From: Tim Deagan <tim@thinkagain.com>
Message-ID: <3vreek$2bu@tivoli.tivoli.com>
Source record: 214256

I am taking my Tech class test this weekend...
(and feel good about it thanks to the practice exams at
http://w5ac.tamu.edu/ham-exam.html , plus "You're Talking Now'
from the ARRL and 'All About VHF Amateur Radio' by William Orr
W6SAI. I promised myself I'd learn real theory and not just
memorize answers.)

Anyway, I want to purchase a dual band as my first HT
and am considering the Alinco DJ-582T (street pricing
at $399).

DJ-582T, Dual Band 2m/440 Transceiver
Features Include:

2W output on 2m & 70cm. 5W w/ the opt. EBP-22 battery.
Built-in CTCSS encoder/decoder.
Full-duplex, cross-band repeater capability.
40 memory channels (any combination VHF and UHF).
Separate volume and squelch controls for each band.
Back-lit keypad.
Receives 135-174 & 420-470MHz. AM 118-136MHz.
Easy mod for MARS and CAP ops.(proper license req).
Bigger bold keypad buttons than DJ-580T.
Easier to grasp control knobs than DJ-580T.
Bright red TX LED.
Accelerated scanning speed.
AM aircraft RX standard.
LCD will display memory frequency of channel number.
Custom molded antenna.

(thanks to HRO for the description, http://www.hamradio.com/)

Any comments? Alternatives I should consider in the same
price ballpark? Accessories I should not try to live without?
Best bet in the next price level?

Thanks in advance!

106. Drake R7: Troubleshooting help needed

Newsgroup: rec.radio.amateur.equipment
Date: 1995-08-03 00:00:00 UTC
From: gatkins@gatkins.seanet.com
Message-ID: <gatkins.12.30201ABE@gatkins.seanet.com>
Source record: 214262

I have a very nice, "fully loaded" Drake R7 receiver that has suddenly started acting up. Can anyone give me any clues as to the problem(s) that may be causing the following symptoms:

--"random counting" of the frequency display on the 3.5 MHz band switch position and on all *higher* bands. The synthesizer is unlocked while this is occuring, i.e. no stations received.

--On some of the higher bandswitch positions, the display just shows the decimal point or maybe that plus 2-3 digits. Pressing the UP or DOWN buttons sometimes causes all digits to come back on and show random counting.

--the 3.5 MHz bandswitch position is the only one acting up that returns to normal if I press the DOWN button. But it is always in random counting when I first switch to it.

--radio operation BELOW the 3.5 MHz bandswitch position is just fine, thank you!

I thought maybe a dirty connector was the culprit, so I treated EVERY connector and PCB pin to a treatment of Caig Labs' Cramolin, but to no effect.

I also suspected that the Digital Control Board was not getting the correct binary data from the bandswitches, so I checked for high-low voltages at the appropriate pins on the motherboard. Nada there, too.

Any guidance would be appreciated!

73, Guy

>Dear Long,

Having just gone through the search, I would ask several questions.

1. Is there a lot of intermod sources around your primary use area? If so, forget Yaesu, their front end is like a seive.

2. Do you need a removable front panel for mobile use? If so, check out the Kenwood TM733 or higher. Good rigs, good front end, and handy.

3. If detatchability is not important, and you are only going to use it in the car, the best buy on the street today is the Icom IC2340. Great intermod rejection, 50/35 watts, lots of features and the best price available...I bought mine from Radio City in Minneapolis--$539

4. Do you need it for packet radio from the shack? if so, you may want to look again to Kenwood as they have the front panel ports to make that very easy and accessible.

My over all recommendation is for the Icom, but then I really like their stuff anyhow.

I bought a Dentron (model <something> jr.) antenna tuner for $30.00 US.
at a hamfest. Did I pay too much?

I was going to use it with a heath HW100, -- now I know I also need
an swr meter. oops, here comes yet another purchase. Nevertheless,
I would gratefully pay cost + postage + thank-you-very-very-much for
the photocoppied manual.

Other than that, I would like to just get a quick overview on how to
get up and running with the thing. It has one meter, and two knobs:
(and no instructions):

#1 transmitter match a,b,c,d,e,f... switch.
#2 antenna match variable.

The back has tx in, ant out, ballenced out, and unballenced out.

any help greatly appreciated. If you have the manual, please contact me
at drumm@uwec.edu.

Thanks!

Dan Drumm

Hi Dan,
If that is the tuner I am thinking about, it has a meter on the front which indicates relative power (with a pot on the back to adjust sensitivity.
I have used the Dentron tuners for several years (both the Jr. Tuner and the much larger MT-2000A. I haven't had one bit of problems with them.
To operate the tuner, you set the bandswitch and then adjust both the transmitter and antenna capacitors for the best match. You can get a rough idea by adjusting for maximum background receiver noise. The settings will obviously change depending on the antenna you are using. The only rule of thumb is the lower the letter setting on the bandswitch, the more inductor you are switching in and the lower the operating frequency.

The is a post on the back for the single wire antenna to which you would hook a long wire or random wire antenna. If you are using balanced feedline, you would put a jumper between the single wire post and one post of the balanced output. There should be a dotted line on the back indicating where this jumper should be placed. In addition, if you are using the tuner on low frequencies and have a hard time matching the antenna, you may want to put this jumper in as the addition of the balun in the circuit will help tune low frequency long wires.
If you will verifiy you have the Jr. Monitor tuner, I have the manual and can copy it for you. You can send me E-mail with an address.

>The joke is on you though, I don't have a dog.

- Then why did you say that mine was bigger than yours ???

>Anyway, at work today I will check the open squelch MDS on my 530 and
>let you know what the sensitivity level is. I doubt it will go all
>the way to .03uV.
>
>As far as the name calling goes I'll end it right here, you got me.
>You win. Feel better?

- Boy, some people start something then try to blame others for it.

- Anyway, I think Yaesu put in some kind of pad in the receiver chain to cut down on the intermod problem they were having. I think that is why the sensitivity was way down in mine and my friend's. I even "real world" tested it on simplex and a friend's Alinco was kicking my '530's rearend. I decided then to sell it and get an 11R. Didn't really use the 70 cm side anyway (except for 800 mhz and I have a Motorola for that).

The AEA Hot Rod is 1/2 wave, not 5/8 wave. Therefore, it does NOT require a groundplane.

That's ok Dave. I don't mind. But think about this. How would you feel if someone that never even owned one of your particular products sat outside your door telling people all you sold was junk??? If you don't OWN that particular DSP, how can your data be accurate?? That is my point. I'm sorry if you chain got yanked! ;-) 73 Tom

123. Software for Used Equp. Tracking

Newsgroup: rec.radio.amateur.equipment
Date: 1995-08-03 00:00:00 UTC
From: brucew@chattanooga.net
Message-ID: <3vqpmr$n3@news.chattanooga.net>
Source record: 214395

I have just completed a Windows program to facilitate the tracking of used and consignment equipment. If you sell any quantity of such equipment and hate the hassle of keeping up with it - and a mailing list to customers interested in such equipment, this may be of interest to you.

This program keeps up with equipment onhand, equipment sold, consignment information, allows discount pricing, AND prints mailing labels to either one-up matrix labels or full page laser labels (Avery #5331) so you can tell folks what you currently have onhand..

Entering equipment is "point & click" and reports are available on demand.

BEST OF ALL, you cannot beat the price: $49.95 incl shipping.

For more information, e-mail me at brucew@chattanooga.net

Hello all,

I have a Motorola Service Monitor, model S-1079A, made in the early 1970's by Systron Donner. The frequency counter works, the converter works, the synthesizer works, but the receiver and deviation monitor does not. I get hiss out of the speaker, but no other audio when I bring a keyed HT near the input antenna, even though I can pick myself up on a scanner halfway across the room. Any ideas? Anyone with a manual for this beast that they would be willing to part with or photocopy? Thanks

The rig is the Scout, made in the USA by Ten-Tec. I am going to order one tomorrow. The rig is not anywhere as nice as say a Kenwood TS-850 which is my first choice (had one a while back) but the Scout dosen't cost $1700.00 either. Keyer built in and 50W will be plenty for most all of your contacts. The next step would be a legal limit amp after getting your Extra! The rig is small and I kept getting my fingers between the VFO and the switches under it. Not a problem I can't live with. Good luck and let me know which rig you get.

The formula for power is p=vi
or
Power in Watts = Voltage * Amperage

So a 1000ma through a 12v line gives 12 watts.

You get the picture....

This is terrible! No "Be-doop?" No tag-team talking clocks? No reverse autopatch? Maybe now repeater installers will look again at the meaning of the word "repeater" and put their money into good radio performance instead of schmaltzy features.

> probert@nspace.cs.ucsb.edu (Dave Probert) writes:
> I was dicussing battery charging with another ham, and
> he mentioned a book by Gates Battery company that he
> said was really helpful.
>
Here is a SLA fact sheet I put together from a variety of sources.

SEALED LEAD ACID BATTERIES FACT SHEET

CHARGING
========================
Quick Reference: Float: 13.65v
Cycle: 14.70v

Float Charge: 2.25v to 2.28v per cell (Power Sonic) 12v = 13.50 to 13.68
2.25v to 2.30v per cell (Yuasa) 2.275v/cell reccomended
Current: No limit (battery will only draw what it needs)

Cycle Charge: 2.40v to 2.45v per cell (Power Sonic) 12v = 14.40 to 14.70
2.40v to 2.50v per cell (Yuasa) 12v = 14.4 to 15.00
Current: Normal is 20% of capacity. Max is 25% capacity
Charge to 2.45v/cell (12v = 14.70v) until current drops to 0.01C
then switch to float setting.

A fully charged battery will rest at 13.5v to 13.8v

Equalizing Gell-cells is not reccomended

Sealed batteries do not vent. Venting implies damage to battery.

DISCHARGING
========================
Depth of discharge depends upon the load. If the load is small the voltage
should not drop as low. If the load is large the voltage can drop lower.

Discharge limits: at 0.1C - 10.7v
0.2C - 10.5v
0.6C - 9.7v
1C - 9.1v

Cycle service will provide about 1200 cycles at 30% depth of discharge(DOD)
Float Service will cause capacity to drop to 80% after 3.5 years, and 40%
after 4.5 years.
Battery will self discharge at about 3% a month. An idle battery should be
boosted every 9 months.

For current calculations based on capacity, keep in mind that older
batteries will not have the same capacity as the battery is labeled. This

is particularly important in calculating DOD.

TESTING
==========
BATTERY SHOULD BE AT REST FOR AT LEAST ONE HOUR.

CONSTRUCION
==========
GELL-CELL: Lead Calcium (Power Sonic) or Lead Antimony

CHARGED:ANODE:LEAD DIOXIDE, CATHODE:LEAD ELECTROLYTE:25% SULPHURIC ACID 75% WATER.
DISCHARGED:ANODE:LEAD SULPHATE, CATHODE:LEAD SULPHATE ELECTROLYTE: 5% SULPHURIC ACID, 95% WATER
TEMPERATURE: LOSES 20% CAPACITY AT 40F

143. Re: M/C Helmet headset

Newsgroup: rec.radio.amateur.equipment
Date: 1995-08-04 00:00:00 UTC
From: 4z9chb@pc.4z7aba.ampr.ORG
Message-ID: <63640@pc.4z7aba.ampr.org>
Source record: 214281

Hi Roger,

I recently put a microphone and a speaker in a full-face M/C helmet for a cellular phone. I put the speaker inside the helmet close (but not too close) to the ear. I put the microphone near the mouth. I used a low sensitive mic to avoid noise of wind (the M/C is a very fast vehicle). All of this what connected to the cellular phone with a plug on the back of the helmet.

What you need for your purpose, is a vox unit to activate the HT to TX, unless your HT has a built in VOX (like Yaesu's HT's). Of course, you should tune the VOX mic to low sensetivity.

Hope it was helpful. Good luck.
73's, Ohad.

According to Ten-Tec, and you can call them at their 800 number to get the details, there are changes in the controls and in the loops. The specs are the same. The Paragon was reviewed in QST a few years ago. I don't recall the date, but Ten-Tec lists reviews in the letter they send with their information.

The feaures you disliked are options, and others like them. I like this diversity in our hobby. I've used ACC products for years, and used some, but not all, of the array of options they provided to me.

The ACC products worked, for the most part, and are incredibly reliable. In several of my systems, the controller provided a service unto itself, with critical telemetry, safety information, Civil Defense triggers, alert paging, automated skywarn call-ups and the like. Sure, you can do these things with any controller or simple COR set-up, but ACC made it easy, and gave me the time to attain 'superior' RF performance. If you think there's no challenge in running 8 machines and their links as a single individual, with over 17,000 square miles of coverage, even with controllers, you're mistaken. I have often arrived at a site (after a day long walk or an expensive 'copter ride) with the right part because the ACC controller gave me the information I needed to be prepared. Like anything in a repeater system, it is just a tool, a part.

I'm sorry to see them go, personally. I like Ed Ingber and I liked the way he treated me as a customer.

Jim,

DTMF is a combination of two tones for each key. There is a row tone and a column tone. The row tones are in the range of 770, 830, 940, 1040 and the column tones are around 1140, 1270, 1310, 1420. I am recalling them from memory, so DON'T take them as absolutes. The actual tone should be listed in the ARRL handbook, or on a datasheet for any number of DTMF chips available at your local Radio Shack!

Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.equipment

Hi:
I have got a broken DC power supply, whose only problem
seems to be a blown BUZ 332A power FET transistor.
I tried to either buy such a transistor, or to find a replacement,
but weird enough I cannot find it in any catalog. I even asked
my friend in Europe to check it for me, but he could find
only BUZ 330 and BUZ 331. So, my questions are:

1. is there any US mail-order source, which would offer BUZ 332A?
2. what is the replacement for BUZ 332A (close replacement) ?
3. anybody knows the specs of BUZ 332A?

Please e-mail to skulski@nsrl.rochester.edu

Excuse me for taking bandwidth in this newsgroup. I could not
locate any other newsgroup dealing with electronic parts, this
one seemed to be the closest I could find.

Thank you in advance for info.

Not here, I have had my TH79a(d) for several months now, not really had
any problems with it. I say not really because when attempting a mod I
goofed up something and had to get it fixed. No big deal. The only thing
is since the repair it occasionally switches bands (being a dual bander)
to other side. But I think that is more related to the
Mike/speaker/remote unit I have for it.

Came to this late. You're probably running into a bad 6EJ7 3rd mixer tube. This is a common problem with the R-4C. It's mostly a "frying bacon" sound on the several copies of the receiver I've had here. Years ago (early 80s) Howard Sartori, W5DA, made a solid state replacement for the 6EJ7 that eliminated the problem and I installed those in my receivers. I'm sure these are impossible to find now, but it may be worth looking around. If you just replace the tube it's also a good idea to do Sartori's 3rd mixer rewire job. E-mail me if you would like to arrange to get copies of his mods; I have an extensive file of R-4C mods and have done 'em all to my receivers and to other folks receivers as well. Modified C lines were the standard outfit amongst contesters well into the mid-1980s. Good luck & 73...

}
Roger,

I have a set of helmets that I have installed an intercom system on made by "Chatter Box". This is a hardwire system and uses VOX between passenger and driver. There is also a plug-in for AUX sound like a stereo or tape player.
I dont see why you couldn't run the speaker to the AUX and wire in an double male ended audio cord for the input side of the mic. With the wind socks over the mic's I hear no wind noise in the audio.

I use partial helmets so if your using full facial this may be a little different.

Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.digital.misc

I am pleased to announce a new product offered by Positive Time Systems called the RCS-I. This is a radio controller that connects to any VHF/UHF transceiver and can issue x-10 commands. (X-10 is a power line standard for controlling devices throughout a building. Sears, Radio Shack, and others offer these compatible units)
The unit also has an alarm input, a listen feature, a short voicmail box, and responds to all commands in a pleasant female voice. The system IDs with your recorded voice and call sign. This description doesn't do the product justice, so please check out the new homepage at :

http://www.halcyon.com/pos.time.sys/top

or you may email us with you address so that we can promptly send you our brochure and newsletter.

NOTE: This product is intended for US voltages of 120 / 220 VAC. Another version will be offered to support other international power standards. Email for more information.

Thank You,

Marshall Craw <mcraw@halcyon.com>

>this.

Ok, Herb, you aren't going to get a good RF ground connnection to
Earth in your situation, but then no one does at VHF/UHF where a
1/4-wave is only 19 inches or less. An RF ground rarely does anything
for you in regard to TVI/RFI anyway (except sometimes making the problems
worse). You need to deal with that at the source, IE make sure your
transmitter doesn't emit any, and use balanced antennas that don't
need to work against Earth so that you won't have a "hot" shack.

The only reason you need an Earth connection is for lightning protection.
Since the bulk of lightning energy is under 2 MHz, a relatively long
run to Earth isn't much of a problem, as long as you keep the inductance
of the run low by avoiding sharp bends and the like, and practice single
point ground window technique where the cables enter the shack.

If your HF antenna is a vertical monopole, or a longwire, IE inherently
unbalanced with respect to Earth, then you may have some problems. If
you're using a ground mounted vertical, put your ground field under
that. If it's a longwire, you may need to run a counterpoise wire.
If you're using something balanced like a dipole or a beam, don't
worry about it. It doesn't need to work against Earth anyway.

Gary

>available...I bought mine from Radio City in Minneapolis--$539
>
[snip]

Are manufacturers or reviewers ever going to quantify "intermod rejection?"
They may quote "spurious and image signal rejection, and this is a
useful figure, but it is not intermod. About all they say about intermod
is "Unsurpassed" or "Legendary" or maybe "Excellent", which of course
should mean nothing to we science-minded hams.

My proposed test for "intermod rejection" of VHF/UHF FM receivers:

*Determine first IF frequency of receiver being tested (fIF).

*Connect a FM signal generator and a CW signal generator to the antenna
input through a power combiner.

*Tune receiver to a frequency near the center of the ham band it is
intended to cover.

*Set one signal generator fIF/2 below tuned frequency and one fIF/2 above.

*Turn up amplitude from both generators (equally?) until receiver quiets to
a certain level.

*Do conventional sensitivity test (with one generator only) on the intended
frequency to the same quieting level.

*Publish difference in levels between intermod signal and desired signal as
"intermod rejection".

As an alternate, setting both generators somewhere above the ham band, but
still spaced fIF apart, may be more representative of the typical usage
with strong commercial signals above the ham band. The + - fIF/2 seems
like it could be a worst case involving various intermod products from the
LO as well.

I realize this test may not be perfect, but it will always come up with a *number* rather than an opinion! It seems that anyone with access to two reasonably well-calibrated signal generators coud do it. It may not prove anything (the actual frequencies that cause intermod problems will vary with IF frequency, thus one receiver with a better specification may do worse than another in a praticular situation), but overall a receiver that does better in this test is likely to generate less intermod than one that does poorly.

Unfortunately, building a receiver to perform well in this test will impose problems with other desired features, such as wide frequency coverage, low power, small size, and low cost, but that is the choice you make, and/or a challenge for the engineers. It seems that low power is not a major problem with mobile equipment, and many of us would do away with wideband reception capability if undesired reception were minimized.

It is also important to note that this test is only for intermod generated within the receiver, much of the undesired signals heard are generated at the transmitter site, and go over the air in the amateur band. These funny noises are "intermod", but they can't be dealt with at the receiver other than by reducing the sensitivity, or in some cases, the IF bandwidth.

Any comments? Has this all been done before?

-Mike KD4QDM

173. Modifying a Yaesu FT-101b for 17meter operation

Newsgroup: rec.radio.amateur.equipment
Date: 1995-08-05 00:00:00 UTC
From: joe@westonia.com
Message-ID: <DCtI1I.5y9@westonia.com>
Source record: 214217

The Yaesu FT101b has 11 meter capability based on the old structure of the Amature radio bands of the time.

Is it possible to modify the unit for 17 meter operation.

Likewise it is capable of 10Mhz recv only, with coverage of the 30 meter band. The transmit may not be possible (or is it ?) but does anyone know how to incorporate a standby function into the system. It supports breakin internally, but I've seen nothing else that would indicate a safe way of having the recvr protected during xmit.

Thank

VE3FMQ

DL> I know that Yaesu has the MH-29A2B, but if it sounds anything like
DL> this one then it would DEFINATELY not be worth it. What about the 32?
DL> How is it's audio? What buttons does the 29 have on top of the unit? I
DL> can see what it has on the front of the display form the brochure, but
DL> can only barely see what is on the side and top. WHat buttons does the
DL> 32 have on it? Are the speakers comparable between these two?

Drew, I use the MH-29A2B on my FT-530. It works very well and is worth
every dime I paid for it. There are two buttons on the top - one is DOWN
and the other is UP. This is to change freqs - either from the programmed
memory presets or in the step increments defined in the individual HT.
The four buttons on the front CALL, VFO, MR and USER are as follows:
CALL - quickly recalls a user selected freq. Might be 146.52 or
whatever other one you use a lot.
VFO - used for going to the separate vfo(s) built into the individual HT.

MR - Memory recall; used for getting back to the programmed memories
from the separate vfo(s). Has other functions depending on the HT
used with it. I am unaware of the FT-51 operation with this button.
USER - This is factory set to switch between bands. I think that it can
be changed to whatever the user wants it to be for. This is from
memory since I can not find the info that came with the 29A2B
right now.
On the side of the mic there is the PTT button and a LAMP(function)
button. Hope this helps you out.

I must agree. I once had a mike go bad for my old IC-730, and living near
them, went in to get a new one. The mikes were no longer available, but the
parts people prowled around until they found a replacement element, which
they charged me about $10 for -- less than the cost of their time looking
for it, I'm sure. The 'ol 730 is still purring along.

hmm (hmm@netcom.com) wrote:
: I am interested in getting an HF radio.
: I have my tech plus and am working on my general.

: My biggest issue is MONEY.

: I have seen an HF radio advertised for $549 that puts out 50 watts, and
: has modules for 30 bucks a piece for the different bands.
: This isnt bad.

You're talking about the TT Scout. While the Scout has gathered fine reviews, once you add in the cost of the band modules, power supply, etc, you're right back in the range of other new 100W HF rigs, which will come with additional useful and not-so-useful features. While the Scout makes a fine mobile rig, you can do better for a home station.

: Other than that, the cheapest ive seen is around 800 bucks for an
: 160-10 radio.

: I dont really like the idea of buying used because alot of times you dont
: know what your getting.

As a beginner, I would HIGHLY recommend purchasing a used rig, with the help of a knowledgeable friend. I know several people who started out in amateur radio by purchasing thousands of dollars worth of new equipment, only to have it gathering dust a year later. Spend $300.00 on a used rig, and find out if you are REALLY going to want to stay in the hobby. If you are, you can sell the rig and typically will be able to get all of your money (or more!) back. The best thing to do is to find a local club and make some friends who will help you out. Several of the local people here in Rochester loaned me spare rigs for extended periods of time, for which I am eternally grateful. :-)

: There are kits through ramsey, and a couple other companies (MFJ?) that
: are low power, and only a single band, but I dont know if these are any
: good.

Stay away from Ramsey. Their kits are generally poor performers, unless you have the knowledge and willingness to do a lot of redesign work on them. The MFJ QRP rigs are fine performers. Generally, QRP isn't recommended for beginners, because it often takes more work to establish contacts. Personally, I started out with QRP because of monetary considerations, and have been working with less than 2 watts ever since. :-) Be warned that if you go that route, you'll need the space and ability to put up a decent antenna.

If you want to try a kit, I would recommend subscribing to the QRP Listserver. Send mail to majordomo@lehigh.edu. In the body of the text, put SUBSCRIBE QRP-L < your name >. Be prepared for lots of messages. :-) Generally, the list discusses everything from antennas to kits, to the weather in Dayton. :-)

Good luck!

- Rich

I've had the Scout since Christmas 1993 and its a fine rig! I operate mostly SSB these days and have received many signal reports commenting on the fine quality audio. Occasionally I operate CW using the builtin iambic keyer and have received excellent reports
on signal as well.

During this low sunspot cycle I have worked quite a few DX stations during pileups. This may
sound surprising with only a dipole antennas and 50w of power but I've cut through some pileups.
I attribute it to the Scout and possibly the antennas I've constructed.

Excellent rig, easy to operate, most affordable HF rig on the market today!

I am interested in purchasing old electro-mechanical calculators such as the ones made by Frieden, Marchant and Monroe from the period of the 1940's through the late 1960's. These calculators did all of their computation with mechanical gears (but were motor driven) rather than using electronics. What I want is one of the more advanced ones that did multiplication and division as well as addition and subtraction.

I am also interested in other old calculating devices such as Curta calculators and slide rules.

If you have an old calculator of this type collecting dust in a closet, and it still works, please send me an e-mail message.

I have owned a Ten-Tec Scout since they first came out and have enjoyed it tremendously. I have had my ham ticket for 15 years and $$ are also a big consideration in my household. I cannot afford a mid to high end HF rig, but would love to have one!

The Scout's performance and features are perfect for a beginning ham. There are some used ones on the market now. Check Amateur Radio Trader (800)77-HAM-AD. It comes out twice a month and you can usually find some free copies being distributed at hamfests and direct mail.

As far as the cost of the Scout goes, the base cost is probably what catches most people's attention. Who can beat $549? You can purchase another regulated power supply for less money. Nobody says you have to stay with the same company for accessories. I bought some band modules and an 11Amp power supply at a ham flea market months before I received my Scout. It took some patience and planning but it paid off.

With the Scout you may buy only

From: girard@panix.com
Message-ID: <403044$2og@panix.com>
Source record: 214229

I have a Yaesu FT-900 AT which I like a great deal; I've had it 2-3 months.

When I bought it I took my older FT-757 out of service and finally sent it to Yaesu for some small repairs. While it was out of service I was using the FT-900 but when the 757 came back I put it in service to try it out. It worked fine, and I packed it up to keep it as a secondary rig.

I then put the FT-900 back at my operating position, plugged it in to its various connections and turned it back on. Ever since that moment it cannot be used on MOX or VOX, only PTT. If I try MOX or VOX the rig turns itself off the moment I try to key it into transmit.

Anyone have an idea about this? It happened yesterday (Saturday) morning, so I haven't been able to speak to anyone at Yaesu. Any ideas out there?

Aside from this new little trick, I love the radio.

Any yes, I tried to reset it. Didn't do a thing.

This is exactly correct, and it should be remembered that no matter what the dealers' priorities, some people will complain. If he provides quality service facilities and customer support, some will complain about the prices that result. If he chops prices to the bone, others will complain about lack of service.

The bottom line is that the market will determine the dealer's success, and his ability to remain financially viable. If the majority of customers purchase on the basis of price, it will be to the dealer's advantage to strip down the operation and forego as many support activities as possible.

This is the nice thing about free enterprise. Sellers not only have to compete for their customers' business, but also, customers will eventually get what they deserve, whether it's what they thought they wanted or not. <g>

of the 30 meter band. The transmit may not be possible (or is it ?)

There are several mods for this, although I haven't installed them in my
FT-101E as yet. Yes, the unit can be reworked to transmit on 10 MHz, and
you can replace the 11 meter crystal to provide operation on a second WARC
band. From what I remember, these two mods are relatively simple. I also
seem to remember a modification that allows full WARC coverage, although I
believe that mod is considerably more complex.

>but does anyone know how to incorporate a standby function into the
>system. It supports breakin internally, but I've seen nothing else that
>would indicate a safe way of having the recvr protected during xmit.

My unit has a separate RF input for the receiver. To protect it when an
exteernal transmitter is being used, you would have to provide an external
antenna relay or TR switch.

I regret that I do not have hard and fast documentation on the
modifications, but the following is a copy of a previous post to this

In So. New Hampshire (Boston metro area) we are very fortunate to have two ham dealers because that promotes competition. I have found the local ham outlet that is not part of a national chain to have better prices and better service. I also like to patronize locally owned businesses as a matter of course because these guys are my neighbors (figuratively speaking).

The ham consumer is like consumers everywhere. They are price conscious and what is wrong with that? If the local dealers prices are too high, then they must take note of their competitors prices. If they are better at service or stocking hard to find components, then they must promote themselves this way. That is what free competition is all about.

Remember that the customer is always right!

Well, I've gotten away with a variety of mounts and antennae. You can usually mount some kind of ground plane antenna on the luggage rack, or perhaps on a grab rail, and it will work OK, but it's a real nuisance, especially for the passenger as the antenna gets in the way while getting on the bike.

A 1/4 wave antenna works OK, too, and isn't as much of a nuisance when mounting. Alternatively, Larsen makes a some no groundplane models - the OM-150K (144-148 MHz), the OM-220K (220-225 MHz) and the OM-440K (440-450 MHz). The OM-150K and OM-220K delivers unity gain without a ground plane and Larsen claims 2-2.5 db over a 1/4 wave with a ground plane of 1/2 wave or more. The OM-440K is claimed to deliver 2 db over a 1/4 wave with no groundplane and 4 db over a 1/4 wave with a ground plane of 24 inches or more.

My experience suggests you not route the antenna coax under the tank - this is usually next to the ignition coils and good for generating lots of noise. And a voltage dropping regulator for the radio is the best way to get clean power for the radio - motorcycle DC power is usually quite dirty. This will work fine for most handhelds, anyway. I eventually settled on throwing mine in a tank bag that plugged into regulated power at 10V from the bike.

Source record: 214156

M>need mods for Kenwood 742a, please

I don't guarantee this will work but here ya go...
------------------------ cut here ----------------------------------

Subject: TM-742/942 Beyond Mars/CAP Mod. Guide

Procedure:
1. Detach the front panel from the main chassis.
2. Remove the bottom cover of the transceiver by removing the 4 screws on the bottom of the cover and loosening the 4 screws on the side of the unit.
3. Orient the radio so the bottom is up and the front panel area is near your chest. Near the front panel area you will find a large board, this is the control unit.
4. Remove the chip resistors "Y" noted in the diagram below, and reinstall them in position "Z" as shown.
5. Reinstall the bottom cover of the transceiver and reattach the front panel.
6. Reset the microprocessor. Press and hold the MR key while the power is switched on. Then release the MR key. This will erase all operator programmed data.
7. The frequency range after modification will be:

28 Mhz Band: RX: 18.0 thru 54.0 Mhz
TX: 26.0 thru 45.0 Mhz
50 Mhz Band: RX: 40.0 thru 90.0 Mhz
TX: 46.0 thru 76.0 Mhz
144 Mhz Band: TX: 136.0 thru 174.0 Mhz
220 Mhz Band: RX: 215.0 thru 260.0 Mhz
TX: 215.0 thru 235.0 Mhz
440 Mhz Band: TX: 410.0 thru 470.0 Mhz
1.2 Ghz Band RX/TX: 1100.0 thru 1400.0 Mhz

Please note that these are theoretical ranges only. Not all radios will be capable of tuning the entire range.

Control Unit X53-346X-XX A/2

A lot of the ham radio dealers such as Ham Radio Outlet, sell a book that is published by ArtSci. They have two books. One book has mods for most Kenwood and Icom radios and also some Radio Shack and Bearcat scanners. The other book covers Yeasu radios and some other brands.
The book sells for $19.95 and I have used it frequently.
My book is about 2 versions old and the mod that it says to do only puts the xmit range up to 152 MHZ. This mod sounds like the one you are attempting and you really should have the book and a good picture of the traces on the board to complete the mod. The new book has the new mod and says to cut the green wire that is comming off the front panel. Then remove the three, three legged chip diodes located in a row and above the VFO pot, on the solder side of the board for that pot. Then reset the radio. Note I would reccomend getting the current book. It may sound expensive to mod one radio, but at least you have the pictures and more reference material for later mods.

218. M/C Helmet Headset options

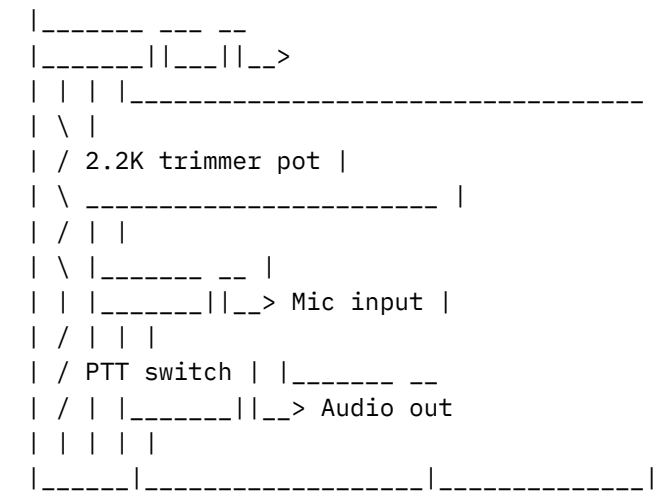
Newsgroup: rec.radio.amateur.equipment
Date: 1995-08-07 00:00:00 UTC
From: kreifels@intel.com
Message-ID: <kreifels.807808516@fmwu23>
Source record: 214166

Folks,

In response to a recent thread, I thought I'd describe what I use
for a headset in 2M motorcycle mobile operation on my BMW K75S.

I use a Nady headset which I scavenged from a wired rider/passenger
intercom. It has a speaker in a 1/4' thick plastic case, from which extends
a gooseneck with the microphone. It claims to be a noise-cancelling mic, and
I believe the claim. It fits between your ear and the helmet liner, and
can be just placed there when you put on your helmet, or velcroed in place.
I tried this headset because I already had 2 with the intercom, and I'm
pleased with the results.

The plug is a mini-stereo plug with the tip as the speaker audio,
and the ring as the mic. I created an adapter to hook to my
Yaesu FT530 so I could use a PTT switch, and also trim the mic gain
if necessary. Really crummy ASCII representation follows:



The 2.2K resistor between mic hot and ground is needed by the PTT circuit on
the FT530, and using a pot allowed me to trim the mic gain. (I don't know
if the pot is necessary or not.) Placing the PTT switch here rather than
in series with the mic allows potential VOX operation (though I haven't
tried it because I yell too much at cage drivers.)

The speaker has plenty of volume to get above wind noise (will really blast
your ears if you crank it.) I figured reducing the mic gain and talking
loud would be my lowest noise operation, but got reports that I was over
deviating. I eventually discovered a normal or even a soft speaking voice
works best. I've been told there's very little background noise.

Where to get these little goodies? Cycle World carried an ad for them in the September issue, page 20. Shows pictures and everything. You can get just the headset for $24.95, or 2 headsets and an intercom for $49.95, or $64.95 with FM radio. Shipping is $5. (Incidently, the intercom is great if you ride with a passenger.)

The company selling these Nady headsets and intercoms for cheap is Innovation Specialties, and their phone is 1-800-222-8228. I price checked the basic intercom against JC Whitney, and these guys are cheaper.

I hope that this will be useful info to some of you. If you want more info, drop me an email.

73, and good riding.

Yes, this has been done. The Electronics Industry Association
and the Telecommunications Industry Association produce a document
called EIA/TIA-603. It outlines standards and test procedures
for all land-mobile communications equipment.

In the case of IM rejection, the test is 2.1.9. Section 3.1.9 outlines the
standards for mobiles, section 4.1.9 for basestations, and section 5.1.9 for portables.

222. Looking for PREAMP NPN Transistor 2SC1815

Newsgroup: rec.radio.amateur.equipment
Date: 1995-08-07 00:00:00 UTC
From: z931205@corn.cso.niu.edu
Message-ID: <Pine.3.89.9508071218.A3600-0100000@corn.cso.niu.edu>
Source record: 214170

Cross Referenced: 2SC1815 (General Electric?, correct)
SK312A (RCA)
ECG289 (Sylvania)
NTE85 (NTE)

Having a helluva time finding a place which carries this transistor,can
someone give me info on where to find General Electric brand transistors?
Any info on good mail-order places to get these from would be appreciated.

Thanks!

Well, there we have it. Apparently the ham receivers aren't "superior",
"unsurpassed", etc. at all, or they would be tested with established
commercial procedures and results published. According to what I see in
these newsgroups anyway, perceived intermod rejection is a large factor in
the purchasing decision by many hams.

>ignorant, or trying to get you to mess up your HT.

It's NOT an HT! The HT is the HTX-202. He's talking about the HTX-212, the mobile rig. It does have extended receive - 136-174, although the memory channels will only allow you to program in channels from 143-149 MHz. And TX extends from 143-149 as well.

>
>>I like this unit but as usual rad shack falls short again....
>

Well, they seem to be learning, though. The 10 metre rig as delivered was quite disappointing, with no repeater offset, etc. The 202 seems quite good to date, and they certainly are attractive from a cost point of view here.

>>BTW any RADIO shack people out there know when basic accessories ie:

>noticed (or I should say the hams I've talked to have noticed) a lot
>of ac noise. The other two are properly grounded and should work
>fine.
>

To begin with, you need a 10 A supply or so. The rig is rated at 45 watts OP, and has a 15 amp fuse in the power lead. The connector, though, looks like an automotive type, although there's no reason you couldn't use a couple of push on connectors for the ground and positive leads in an emergency.

I've asked here if the mic connector was available separately and the local dealer didn't know, he was going to check on it.

>For packet I've heard that the MFJ-5024X or the MFJ-5024YV is what you
>need (the specific one is based on the TNC, or so I've been told).
>These are NOT RS cables, get them from a ham shop or mail order.
>

All you're really going to need that's unique is that oddball 8 pin mic jack and a standard 1/8 mini phone jack for the audio O/P.

225. Source of small footprint Mag-Mount 1/4 wave UHF antenna?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-08-07 00:00:00 UTC
From: cyamamot@kilroy.jpl.nasa.gov
Message-ID: <405s1g$nah@lo-fan.jpl.nasa.gov>
Source record: 214173

Greetings,

Well the subject mostly says it all. I don't wish to drill a hole, but I don't want to use glass-mount either. I will keep the soap-bar sized mag-mount Larsen for when I need to mount a longer whip, but for my daily driving a 1/4 wave UHF "spike" will suffice.

I'm basically looking for a 1/4 wave UHF antenna similar to the NMO style "spike" but with a small circular magnet glued in where the threads and center conductor are. Then a small coax feed coming out the side of the base of this.

Any leads on something like this would be appreciated. It seems silly to have that large soap-bar sized mag-mount base for such a tiny 1/4 wave antenna.

Thanks & 73's
- Cliff

Short of ordering the actual connector directly from Icom,
Slip over to the Atlanta HRO. I'll bet they have a complete
power cord for the Icom's in stock.

Cliff: I got a mini-mag mount (with a BNC connector) at one of the Ham-Fests (I think it was PACIFICON '94 in Concord, CA). Ic cost me $14.95 or so and it works well with my ANLI S-10 1/4 wave antenna. Notice that this mount has a BNC connector, I don't know it they sell one with a NMO type. The mount by the way is about 2.5 inches in diameter.

Good luck

This was a post about the mobile unit, not the HT. Perhaps it would help if people actually read a message before they tried flying off the handle replying to it. Actually it would be interesting to know about mods for the mobile unit from Radio Shack. I don't recall seing anything about it myself one way or the other.

Er, Rodney, he's talking about the HTX212, the new RS *mobile rig*.
There is a keypress mod for MARS/CAP, it's in the manual. I haven't
heard of other mods yet, and there might not be any, following the
lead of their HTs.

As for accessories, I haven't seen any yet either. The microphone
connector is one of those funky telco type plugs, RJ-45 I think.
You'll probably have to make your own packet cables. (The odds
of the Kenwood cables working is probably slim or none.)

>
>Thanks & 73's ..... Roger N9PMC

The "in the ear" mikes I tried picked up more engine noise than a standard hand mike.
Totally useless...
I bought a throat mike / earphone combination at Dayton. I believe it sys it is made by
Genesis, (or some variation on that
spelling). It works pretty well. Reports indicate that although there is a lack of high
frequencies, no engine or wind noise
can be heard.
The one problem is that the mike must be precisely positioned or it does not pick up well.
Unfortunately, the mike is clamped
to your neck with a piece of spring steel bent into a half circle.
This works ok if you never perspire and are a pencil-neck geek. Otherwise, you will find it
springing off your neck again and
again. Don't even think about putting on sun lotions or it will rocket off your neck as
soon as you release it.
I think if you replaced the metal hoop with an elastic loop it might work well.

Remember, a magmount base is one plate of a capacitor (the body being
the other plate) for the purpose of offering a low impedance for RF
at the operating frequency. It's not large for mechanical purposes,
but rather for electrical purposes. If you used a tiny base area,
it'd likely work no better than a on-glass antenna.

When I was stationed in Japan years ago, the equipment that was
marketed in the US as Kenwood was sold in Japan as Trio. As far
aw I know that was the only difference. This included both HiFi and
amateur gear. You may have a radio that was brought back from
Japan by some GI. If you need schematics or other info, try
writing the company in Japan. I did this with a Teac tape deck many
years ago and was rewarded with complete technical documentation about
a month later.

Hello

If anyone knows if there's a way to program a Motorola Radius UHF mobile radio through a PC, please post or mail me. The radio has an 8 pin modular mic pluc, and a 14 pin plug on the back. Thank you.

> .... some stuff deleted...

Diversity is exactly the point. If you only want a simple controller there are
many low cost controllers that work well - I frequent a repeater with just
such a controller.

If, however, you want top end features and performance (as the ACC price
indicated it was) then ACC was stuck in the early '80s. The incredible
advances in computer technology in the past 15 years was largely lost
in the ACC designs. Some improvement, yes, and if the consensus was
they were reliable, fine. But I *like* the schmaltzy features .

But the bottom line is this: People paid for their controllers ... I
just simply stated that now maybe some of the other smallers guys
will get some well-deserved recognition and repeater managers will get
better controllers - if they want them. I'm sure you can still
suck off of ACC's teats in the used market for years to come if
you want.

250. Re: Newbie question: What is TRIO?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-08-07 00:00:00 UTC
From: grhosler1@mmm.com
Message-ID: <405lqo$aih@dawn.mmm.com>
Source record: 214198

The Trio Kenwood label is generally used for equipment delivered OUS while equipment designated for US has only the Kenwood name without the parent Trio identifier. The TS-520D may look identical, but you may want to check the output into a dummy load on all bands. If memory serves, units designated for the Japanese market had low output on 10 Meters. The low power problem could be overcome by shorting the screen voltage resistor attached to the band switch. With this modification the unit should produce about 100 watts output on 10 Meters. Good Luck & 73's

Look into diamond antennas. The NR-770 is a classic 2/440 3/5.5db design
that needs no ground plane, hence the NR designator (no radial?)
Others are available, mono or dualband, of varying gain.
Their mounts, although pricey, are nice too.

>by duct taping a scanner onto the radio, sounds good to me.

You know, an R390A duct taped to the other side, would give pretty much
DC to daylight coverage, too. Hard to hand on the belt, but that isn't
where a "shack" belongs, anyway.

Lately, I've begun recommending the following mod to many import radios:

1. Remove top cover
2. Pack inside of radio carefully with potting soil
3. Put in seeds appropriate to the size of the radio (you wouldn't want
an oak tree trying to grow out of an HT, would you?
4. Water thoroughly. Repeat often.

This mod DOES require figuring out how to get the cover off, but this can
be done using a screwdriver/crowbar/what-have-you and does not require
even OPENING the operating manual to puzzle out the way to turn the
radio on.

:-)

NO mods are possible. I know I've posted this a couple of times and
I've seen others say the same thing. There are no mods for extended
RX , TX or memory. If anyone tells you different, they are either
ignorant, or trying to get you to mess up your HT.

>I like this unit but as usual rad shack falls short again....

I disagree. I have one and think that for the price it is quite good.
If you want one better, and there are quite a few, be prepared to pay
the extra bucks and not have a local shop to take it into if you have
a problem.

>BTW any RADIO shack people out there know when basic accessories ie:
> Power cord
> packet adapter
>will be available ??

What kind of power cord? If it's a cigarette lighter cord, it's
already available at RS for $3.99. For an AC to DC regulated power
supply, the 1A is 21.99, the 1.75A is 27.99, and the 2.5A is 32.99 (I
think, those prices are off the top of my head). I would stay away
from the 1A power supply. It does not have an AC ground, and I've
noticed (or I should say the hams I've talked to have noticed) a lot
of ac noise. The other two are properly grounded and should work
fine.

For packet I've heard that the MFJ-5024X or the MFJ-5024YV is what you
need (the specific one is based on the TNC, or so I've been told).
These are NOT RS cables, get them from a ham shop or mail order.

Hope this helps,

Rodney, KB0SPZ

Then you should be definitely be looking at used radios. A couple
of good radios to look for are the Yeasu 747 and Kenwood 140. Both
are fine simple radios and should be available for the kind of money
you are talking about. Hope you find what you want. Good luck.

You don't have to modify the 411. It is already built into it.
It's been a while since I owned a 411 but if I remember all you have
to do is hold the arrow keys down while powering it off and back on.

From: kmawji@Direct.CA
Message-ID: <404947$5mg@grid.Direct.CA>
Source record: 214248

I've been thinking of getting into some am dxing. I live 300 miles north of Seattle, and someone told me that a GE superradio III along with 100 feet of wire strung 40 feet up in the air would allow me to get am channels from california as well as any other channels up to 1500 miles away.

I was just wondering is this equipment very good or is there anything that is better. Also does anyone know of a company in Seattle or in Bellingham that carries the GE superradio? I am completely new to am dxing and would appreciate any information anyone could give me.

I don't get a chance to read this usenet very often so perhaps someone could email me with some advice.

Thanks

Karim

: packet adapter

What kind of power cord? It comes with one, right? Near as I
can tell, the connector on the radio is just two .250 spade connectors at
right angles to each other, which should be easy enough to duplicate from
scratch. A replacement for the original cord could probably be ordered
from RS's parts warehouse, too. If you mean a power _supply_, to be able to
run it from 120vac house current, I'd like to see us carry one too.

As far as packet goes, RJ-45 connectors (for the mike input) are
found with phone accessories, and the 1/8" mono plug is with other audio
connectors and adaptors. The manuals for the radio and the TNC should
have enough information to build a cable, at least for 1200 baud packet.

I suspect (and hope) that accessories for the -212 will be in the
1996 catalog, due to come out within a few weeks, but I don't know.

Same here. I sent in my 2GAT for a freq adjustment. They even put in new screws and rings, which I wasn't expecting. Actually, I know someone who worked there in their receiving department. It was his job to take the radios apart (as in the antenna and battery) and put them into these plastic boxes. It was his summer job. He's not a ham though.

A suggestion... you can send elements you already have (if you have any)
to a place like International Crystal Mfg and have them recrystaled. It
costs between $30 and $50 per element and takes about a month. I have
done it several times and ICM is who I trust most.

From what I remember, the 2SC1815 is a common device. Try an audio/video service center. If they don't have the exact number, they should be able to look up an equivalent Japanese type that has equal or better specs. Stay with a Japanese device (rather than a generic replacement) if you can.

Ohhhh.....Joe.....DUCK NOW!!!!!!!!!!!!
I cringed when I read your question. I posted a query along similar lines a long time ago.....and.....WHAM.....in came all sorts of warnings and responses in regards to using ham rigs out of band. All the 'Non FCC Type Accepted' flames. Actually mine was a 'Want to Buy' posting in the AOL forums for a police buddy of mine who is not on line. Despite all the flames I ended up buying the radio (Alinco DJ580) and modified it to suit the situation. Through it all though, I wondered why the manufacters would make their rigs capable, then, lock out its capabilities, then, advertise that it is modifiable for out of band use, then, provide mod sheets with the info needed to perform the mods, then, warn you that such modifications will void the warranty and render the radio non type acceptable. Go figure. I do advocate good ham practices and do not abuse the technological capabilities of my radio equipment. I have several close law enforcement friends who are also hams and own modified 580's for both their 2 meter ham use and their private duty and tactical work on the 453.XXX band. It's a workhorse of a radio for the purpose and for the money and the modification, which is widely published, is simply clipping a red and a blue jumper wire. The standard disclaimers apply here.....any opinions expressed here are.....well,.....mine.

What is the trouble with your 2410 ? I've owned one for 4 years with no troubles at all been a great rig for me. even used it as a cross band repeater during ARES functions for 8 hours straight with no problems. Always mounted in my truck.

>complaints about them.

Can't say much, I guess. I ordered a Yaesu FT-2400 and an Astron RS-20M power supply from Radio City the week before Dayton 1994. Overall the person I spoke with was pleasant and answered all my questions. The prices quoted were on par with AES and HRO, but he whipped their shipping costs hand down.

I have never really gotten a good grasp on shipping charges. More to the point, if UPS charges $7.50 shipping, why does A charge $25 and B charge $15 when both are in the same zone?

It seems some companies are using "shipping charges" as profit enhancers of sorts.

You can't go wrong with the TS-520S Billy. I have a pair of them and they have served me well for nearly 15 years. Use one at the lake home near Hayward and the other at the home QTH in Wyoming, MN. One of the units is finally starting to show signs of needing a new pair of finals (after almost of 12 years of daily use). They certainly aren't as selective as a new ICOM-775DSP, but then again the average asking price is about $3700 less! I wouldn't own one without a narrow CW filter. If you have any specific questions, feel free to call me evenings at 462-3370 or during the day at 733-4466. 73's & CUL

277. 3-500Z Open Filament Problem

Newsgroup: rec.radio.amateur.equipment

From: grhosler1@mmm.com
Message-ID: <407ora$mho@dawn.mmm.com>
Source record: 214116

I have a TL-922 with a pair of 3-500Z's that has performed well over the years however I had a problem this weekend that perhaps someone can shed some light on. When I fired up the amp and tuned it up I realized that there was very little output. After some time spent checking out the expected faults I finally found that pin one (filament) on one of the 3-500's had lost some of its solder. I resoldered it and am back in business (although not sure if the problem will rear its ugly head again). I would guess that the problem was caused by inadequate filament pin cooling (air flow), but would like to hear from others that have had similiar problems. I spend most of my time on CW so would think that the duty cycle shouldn't be a problem. Besides that the TL-922 has a delay built into it to maintain the cooling fan for a period of time after the amp has been turned off. Would appreciate any input regarding the root cause and possible fixes. 73's & GUD DX

278. Gunn Transceiver info needed

Hi!

I am an undergraduate student in Electronic Engineering at the University of Stellenbosch in South Africa. For my final year project I have to build a 10Mb/s microwave data link. For this reason I need info on microwave transceivers, most notably Gunn diodes, etc. Unfortunately information is a bit hard to come by so I am turning to the Internet for help...

I am particularly looking for information at Gunn transceivers in the 10 to 11 GHz range. I am quite interested in the NEC ND751AAM Gunn transceiver, but I am unable to reach NEC through the net. Anybody out there know how to contact them, or at least get some info?

Thanks,
Pierre

Joe, they all are. FCC Type Acceptance is required, however, for
radios to be used in the FF and EMT service frequencies. None of
these radios are type accepted for that use, nor are they guaranteed
or warranted for use outside of the amateur bands.

I know many are doing it and not everyone will get caught but getting
caught could subject one to equipment confiscation and hefty fines.
[Just thought you'd like to know that.]

Hi Bill

I had a TS520S for many years and it was always a top performer. Never had the slightest bit of trouble with mine. In 10 years of ownership, I changed out the finals once. I always got good audio reports, good cw reports on tone and character reception, and the receiver was always hot. The noise blanker was really quite effective against pulsating noise. All in all, I would highly recommend it to a novice. I don't know what the differences were with the 520SE, but I sure it was the same basic rig. Try and find one with the CW filter installed. The filter may be hard to come by sepparately, but it adds much to the receive quality to the CW.

Good luck and 73s
Steve, WA6TAF.

>Ohhhh........Joe.........DUCK NOW!!!!!!!!!!!!

Rick (and Joe), I'm sorry if you take this as a flame, but it is a Bad Thing to use an amateur radio on public safety or commercial bands, for a number of reasons.

1. You will get in trouble with the license holder. For your law enforcement friends, this means that their radio officer will chew out their captain who will make your friends' lives unpleasant.

2. You may get in trouble with the FCC. You don't want this, trust me.

3. You will hurt Amateur Radio. Transmitting with non type accepted equipment adds to the perception of hams as unprofessional bootleggers and hackers. (There are many radio and public safety professionals who really feel this way.)

4. If enough people are caught using amateur radios out of band, the government will impose greater restricitons on the equipment manufacturers, increasing costs for everyone.

The reason manufacturers "make their rigs capable," is not to tease you. To the manufacturer, the rigs are not modifiable, they are *configurable*. If a manufacturer can make one rig to work in many markets throughout the world, costs go down for him, and prices go down for us.

Please, think hard before you transmit out of band.

> SK312A (RCA)

RCA's SK line is defunct, closed when GE bought
RCA. (Phillips may have absorbed it when they
bought the parts of RCA that GE didn't want.)

> ECG289 (Sylvania)

ECG is owned by Phillips now.

>Having a helluva time finding a place which carries this transistor,can
>someone give me info on where to find General Electric brand transistors?

I believe GE shutdown or sold their transistor line around the time they
bought out RCA. Not that that's relevant, your transistor is Japanese.

>Any info on good mail-order places to get these from would be appreciated.

According to the current Phillips replacement guide, what you need is
the ECG85, a NPN silicon GP switching transistor. That should be available
nearly anywhere ECG parts are sold, IE darn near everywhere parts are
sold. Any of the bigger distributors such as Allied, Newark, Hallmark,
Wyle, etc, will stock them (and most of the remaining mom and pop operations
will too). Even Radio Shack can order it for you under their express
parts system.

Source record: 214126

This sunday evening I was first on the scene at a motor vehicle accident. So I hauled out the 2M HT, looked up the local repeater, and did a "CQ, need an emergency call", got a local ham to make a 911 call for me.

However, some of the repeaters with phone patches are listed with option "Z" in the directory, direct access to law enforcement or emergency services. As a transient, I don't have phone patch access, but can I access the emergency service without knowing the unique codes?

How do I do this? If it had been 02:00 in the morning, I might not have found a fellow amateur listening on the repeater...

I am in the process of resurrecting a Clegg FM-27B 2M rig.
Because of where I live, it is imperative to have PL, which is
obviously not in the rig. Ideally, a Communication Specialists
PL board would work, but for a rig that cost $30, a $30 to $40
board is prohibitive.

If anyone has an old 'add-on' PL board that they would like to
sell, please E-mail me at 74273.355@compuserve.com with your
asking price, model and if the board is currently working or not.

Thanks in advance!

292. Problem with BP-7B

Newsgroup: rec.radio.amateur.equipment
Date: 1995-08-08 00:00:00 UTC
From: mruss5679@aol.com
Message-ID: <408j0k$i6c@newsbf02.news.aol.com>
Source record: 214131

I use a "generic" BP-7B 13.8v 600ma battery pack for a HT. I say generic because there is not a manufacture plate on it, but the circuit board in it says BP-7B. The problem arose oneday when I could no longer transmit with it. The cells check out fine, the resistors and transistors all seem to check out, but I can not get any voltage to either the testing screws at the bottom, or to the plate at the top. Has anyone had any expreience with the relay contacts going bad? When the pack is on charge the relay energizes and the charge light comes on. I'd rather not throw away $50.00 that I spent on it, so I am wondering if anyone has any information on the problem, or where to send it to be repaired.

Thanks for any info...

294. Re: What resistor to use as a dummy load with QRP rig?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-08-08 00:00:00 UTC
From: Zack Lau <zlau@arrl.org>
Message-ID: <4081n1$c33@mgate.arrl.org>
Source record: 214133

I got an email that said Radio Shack metal oxide
resistors looked inductive, though he didn't have
the test equipment to make a measurement.

Anyway, I went ahead and bought two RS 271-152A
100 ohm 1 watt resistors and wired them up in
parallel.

The return loss is about 34 dB at 1 MHz (pretty good
measurement, the HP reference I use is about 54 dB)
It seems to get better with increasing frequency--to
about 39 dB RL, though this could be due to the coupler,
which indicates only 43 dB of return loss with the HP
reference.

For those who think in terms of SWR, a 34 dB RL is
a 1.04 to 1 SWR.

I've yet to hear a report involving actual
measurements of metal oxide resistors having
inductance significantly in excess of what you
might expect from the size of the resistor.

Hello.

I just recieved the SB1000 and noted that it has three of its little lamps burnt out. Where can I get a replacement? Or better yet, are there cheaper replacements that I could get, say, at the local hardware or automotive store.

The same questions goes for the FT101E and the TS830S...

Thanks,
Marc

KD4FXA

Dear Rick

Thanks for your timely response and the very appropriate heads-up. As a former licensed General Radio Telephone operator for the Broadcast Industry, I understand an appreciate the consequences/ramifications of my actions. No one has more disgust for hackers and those who operate outside of the law than myself. But there comes a time in every mans life when he realizes he has enough gadgets (wife applauds in background). My goal is to reduce and combine the amount of stuff I carry around, It's probably just a pipe dream though.

Anyway... thanks again for your response and if you have time could you pass on some information or point me in a direction to get information about the Alinco DJ580. I'm just starting my research and don't have a lot of background material yet.

303. Yaesu FT51r DC supply

Newsgroup: rec.radio.amateur.equipment
Date: 1995-08-08 00:00:00 UTC
From: rmcgarra@prairienet.org
Message-ID: <4086bm$t18@vixen.cso.uiuc.edu>
Source record: 214142

I recently bought an FT51r and it is an excellent radio. I can vouch for all who have said the computer programable interface is a great feature. My question is in regards to powering this radio from a DC supply. My old FT470 had a PA-6 adaptor with positive and negative connections which was easy to hook up to a DC supply. The 51r has four terminals, Batt, Batt Sel, Gnd, and Adaptor. The radio doesn't respond to just connecting a supply to the Batt and Ground terminals.

Has someone out there figured out how to power this radio from DC without having to use the E-DC-12 adaptor? I just don't like the idea of leaving my battery in the charging circuit all the time when I'm using the radio as a base station. Thanks.

304. Power connector for IC2GXcom 2GXAT

Newsgroup: rec.radio.amateur.equipment
Date: 1995-08-08 00:00:00 UTC
From: miller@polaron.physics.colostate.edu
Message-ID: <408ad5$hlp@polaron.physics.colostate.edu>
Source record: 214143

Can someone help me locate a source for the external power connector for an Icom 2GXAT? I called Icom customer service, and they will only sell the entire transformer unit. I don't need the transformer, just the connector that plugs into the top of the unit. This connector is a bit unusual, in that is "gender reversed" compared to about any other piece of consumer electronics sold within the last 5 years. A visit to the local RS store failed to turn up the proper plug. I still have a few other local sources to check, but I would appreciate hearing from anyone who knows a source for this connector.

I had cut the cord on my transformer, and spiced it back together using a standard connector rather than soldering it. This way I could plug the HT into a variety of 12V sources. Unfortunatly the short cord with this plug on it has gone MIA.

Thanks,

Al

305. DJ-180 Frequency range

Newsgroup: rec.radio.amateur.equipment
Date: 1995-08-08 00:00:00 UTC
From: JHGK51C@prodigy.com
Message-ID: <408b6v$l0o@usenetw1.news.prodigy.com>
Source record: 214144

If you only have 140 to 148 MHz range on your DJ-180, it must be reset to expand it to the normally available range of 137 to 174 MHz.

Turn radio off.
Hold down the LAMP key while you turn the radio on.

It that doesn't do it, repeat the above while holding down both the LAMP key and the FUNCTION key and turn the radio on. (This proceedure given on a repair report from Alinco).

It is a mystery why this is not in the manual.

The DJ-180 can be made to transmit on all frequencies with a simple wire-cut.

The Icom BP7 used a tiny length of fuse wire on the circuit board. This
happened to me once and a few people I know. I don't recall if the pack
would still charge or not. But try inspecting the board for a very small,
very blown, "fusable link". They looked like a small piece of bare wire, as
I recall.

Unfortunately, not all of us are lucky enough to have an amateur radio dealer
within 100 miles. There is a CB store nearby run by a ham and he carries some
ham gear -- mostly antennas and such. He says he has tried to get Kenwood,
Yaesu and Icom gear but no dice. So for me it's mail order or Radio Shack, and
we all know Radio Shack doesn't carry HF gear.

I have had a FT-900 for about two months, love the memories (previously TS430S) and the built in Antenna Tuner.

Memory access is a bit more complicated than Kenwood, plus the 10 meter sensitivity isn't anything great - the TS-450 is supposed to have devoted special attention to 24-30 MHz receive performance I believe. Note that I am using it as a shack transceiver, so haven't taken advantage of the included separation kit. For your mobile application it would be great.

MA> claim to eliminate power line noise but do they?

If you're a homebrewer, you might want to check out the July
1994 issue of QST. It has a "null-steerer" you can build and would
out noise blank any DSP. The secret is to eliminate the problem
BEFORE it get's to the AGC. Someday, maybe someone will build a DSP
that processes the IF rather that the AF...Good Luck!

>3. There is no problem! (!?)

No problem, you need an adjustment. Maybe. Your IF shift control moves the filter through the IF frequency, and the center frequency is at top dead center of the IF shift control, at least when it leaves the factory, and using the standard filter. Your Narrow filter might actually have a slightly different center frequency, offsetting the IF shift effects.

The thing to check is whether there is somewhat the same effect with the standard filter in, even if it is slight. If you notice the same problem on a reduced scale, or if your transmitted audio seems not quite right (check on your next comfortable QSO, switch from USB to LSB with the station and ask if the nature of your audio has changed....). Then, pick up a service manual and do the adjustments. On my Kenwood 440, I needed to adjust the carrier oscillator and some other stuff to get the IF shift just right and to get the transmitted audio right after I installed a new pair of filters. I suspect something similar is what you would need.

I have received a Regency Model VHF radio. It is a large
radio with a keypad on the front. It can be programmed from
the keypad by placing a jumper inside the radio. Currently,
I have no instructions on the programming process. Does
anyone have access to this information?

If your problem is REALLY noise being radiated by power lines close to your location then something like the ANC-4 from JPS could be a MUCH better solution for you than a DSP.

There are a number of reasons, but the primary one is that it is better to eliminate the noise BEFORE it gets into your receiver and destroys the noise floor, generates problems with receive-end phase noise and screws up the AGC response. Remember, that audio DSP processors are applied AFTER any damage has already been done to receiver performance.

DSP units definitely have a place. I would find it hard to be without one now that I've used them for a while. But the ANC-4 might give you much better results over all for this specific type of problem. I have severe powerline noise at my location -- a combination of trash that the local power co-op either can't or won't fix, and reradiated "touch lamp" trash from a couple of neighbors. The ANC-4 (with an external noise antenna, just a short whip, located out between my antenna and the power lines gives far superior results compared to DSP processing alone.

Hello All,
I am looking for some info on the Yaesu FT-51R. Are there any
problems with it? Likes? Dislikes? Also, I have heard that some of
them get spider-cracks near where the battery connects and it needs to
be replaced. Is this true? Also, any other info on this rig would be
appreciated!
I am interested in buying one and want some info about it before I
do so. Thanks!

Please reply at: n5zgt@swcp.com

Mike,

I just bought a Timewave DSP-59+ a few days ago, and am very pleased with
it. I have had the opportunity to try it out with some rather severe
line noise, and it works very well. In one case, it dropped an S-7
noise level to virtual inaudibility. I am finding the unit very useful
overall, and it is very well made.

The day I got my HF privileges, a buddy of mine gave me his TS-520 to use until I could pick up a rig of my own. I used it for about 3 months, and it's a very good rig. Simple to operate, easy to tune, very forgiving.

You will be very happy to own one.

In fact, when I did get a rig, I ended up with a TS-820S, which is just a newer version of the 520. It uses the same transmitter section as the 520 (3 tube), and looks very similar.

If you can get a good price, go for it.

Bill
I am still the owner of an ol' TS 520. Great rig! Hears well and
good clean tx. It takes only a few times to get the hang of tuning
one of these up. Also, if something goes wrong you can pop the
top and work on it - little transitors, not those multilegged
monsters... The 520 series are sturdy, great for field day when
folks with expensive more "delicate" rigs are shy about getting
their rigs hit with a heavy morning dew or noon-day baking.
Go for it!

Might also try Panasonic as Matsushita is the parent corp.

I've had miserable luck with the in the marine equip. dept. I once spent over an hour and about 10 phone calls only to finally be referred back to where I started by Matsushita. I then called another company who sold the same radar under their name and was helped within 2 minutes. What a joke.

Hope you have better luck with the cell phone dept.

Hi Dan, You have an old channel master rotor, and all of the 3 wire rotors were basically the same. A new control box will run you old motor. I believe its something like 20 volts AC to run the thing if you want to make your own control.
We just used one of those beasts this last field day....but we had a 12V DC motor installed in it (we were QRP Battery) it worked quite well.

Try putting a 50 ohm dummy load on the output and see if it still
happens. Mine did that once when I put the wrong antenna on it.

I have had my FT900 mobile for over a year with excellent results. The
only problem I have had is the two hours it took to install the CW
filter. Out of six rigs I have put htem in, the 900 was by far the
toughest.

Good Luck!

>
>How do I do this? If it had been 02:00 in the morning, I might not have
>found a fellow amateur listening on the repeater...

It depends on how the repeater is programmed, and it isn't "standard" on all repeaters. Often dialing 911 on the patch does the trick, but not always. On one repeater in Louisville, KY, for example, 911 dials Jefferson County Police, 912 dials Louisville City Police, 913 dials either EMS or Fire Dispatch, etc. On another repeater just across the county line, it's something like 2468 to get Jefferson County Police.

Your best bet is to ask for assistance if you aren't familiar with the repeater.

Source record: 214065

Can anyone suggest where to buy modules or kits for Amateur Television.

I would like to convert the Channel 3 output from my video camcorder and translate it to the 70 cm band (430 MHz).

I need a converter and a amplifier with a few watts output since I'll only be transmitting less than 1/2 mile line of sight.

I'm mainly looking for PC card Kits such as those made by Communications Concepts. Are there any others making them??

Reply to me by e-mail.

Thanks,

John, W6XZ

352. Help on a rig, 2m,HF freq? Does it exist

I can definitely state that that request is no more. If there's
anyone local to you who's still asking for the last four, ask him/her to
speak with Mr. Hainline for correction.

However, why is this such a concern? I've seen several people
who've had a problem with this (which is, I presume, why they've changed
the system), but I really don't understand why. In my experience (from
both sides of the counter), the information is optional anyway--if I
didn't want to give it, that was acceptable. I guess what I don't
understand is why people object to indexing the database by the last four
digits of a phone number, but don't mind indexing by last name.

Can't say for sure, but if I were a shop shipping a $2000 HF rig, I would definitely want to make sure it was insured to the hilt. I've seen enough munched UPS packages come through our warehouse door. Also, the mail order dealer has to pay someone to package that puppy so it can resist shipping gorillas. Boxes aren't cheap, either. If the mail order shop has lowered their margin on items enough to make the average ham only grumble a little bit about how expensive these rice boxes are, he probably can't really afford to absorb all the shipping expense.

358. Help me ! schematic diagram...

Newsgroup: rec.radio.amateur.equipment
Date: 1995-08-09 00:00:00 UTC
From: victor@ibpm.serpukhov.su
Message-ID: <victor.84.0@ibpm.serpukhov.su>
Source record: 214072

I have Kenwood TH-25A which was broken recently. Receiver and syntezator
are OK. But I have no carier on air, although TX Led is light.
Probable problem with output RF amplifier or more likely with power supply
for RF amplifier - I not hear even weak signal on an other Radio near
my TH-25A.
When I press PTT and some DTMF keys I not listen sound, which I hear
early when HT was OK. Maybe problem with some control circuit, - not with
RF output or power supply ?
Anyway, I need a scheme (block diagram, board layout, schematic diagram)
for analyse and repair. I have a manual only.
If you can make a copy and send paper to me, PSE let me know. I'll be
kind.

Same here. I'm a tech-plus. (Got my license before no-code was around, but I look forward to pounding the brass on HF.) I'm also a college student. (Which means little money.)

My suggestion, go with tubes. Looking at some of the prices people've been posting on the boatanchors mailing list, it seems one could get an all-bands CW / SSB setup for around $300 or less if you're willing to be patient and look around. Heck, my Heath HW101 was GIVEN to me by a high-school teacher. It's not working 100%, but I'm certainly learning a whole lot by getting working again.

Tubes may be flaky, they may be hard to find, but once you warm up a tube rig and watch those firebottles glow, something just happens inside of you. (At least it did for me.)

> I dont really like the idea of buying used because alot of times you dont
> know what your getting.

Find yourself an elmer to go to swaps with. And even if you do buy a radio that's not-quite-in-good-condition, enjoy fixing it up. You'll probably learn a lot. (Which is a plus for the tube rigs... they're usually easier to tinker around with than silicon-based rigs.)

No, it is an amateur band only coverage, without the WARC band coverage.
The receiver has decent sensitivity, but it suffers considerably from
overload problems if you're close to other RF sources. Also, don't
expect to work any full break in operation, as the AGC is not all
that good. I still have mine, and probably won't be getting rid of
it. It looks like a good receiver to use with receiving converters.

<snip>

In a word, _NO_. There are absolutely NO modifications for the HTX-202.
Radio Shack got burned badly on the HTX-100. When they bought the license
from ICOM to build the HTX-202 they changed the design slightly and
contracted MAXON to build it for them with the stipulation that it was to
have no possible modifications to give it out-of-band operation.

I believe your problem is a high resistance contact between the tube pin and the socket. The connection has probably oxidized and the IR loss is heating the pin to the solder melt point. Clean the contact good, be sure the socket contact is making the proper connection to the tube pin and hope for the best. You might try something like DeOX on the contact to reduce the possibility of oxidization or at the worst you may have to replace the tube socket. GL & 73 Jim K4CGY

From: owen@apollo.eeel.NIst.GOV
Message-ID: <48809.owen@apollo.eeel.nist.gov>
Source record: 214087

The HeathKit SB-303 was one of the best receivers that Heath made. A little tricky to align (you need extender cards to work on the PC boards) as I remember. However, it is NOT a general coverage receiver, it's Ham Band Only. I believe that the SW version receiver was the SB-313 and that covered only the most popular SW bands about 8 I think. The value of a SB-303 is not more than $150.00 in my book. For about $200.00 you can get a Drake R4C which is much better than the SB-303 and has slots to insert crystals for about 10 500 KHZ bands of your choosing plus the ham-bands it comes with. If you add the FS-4 synthesizer (about $250.00 if you can find one) than you can cover all frequencies from 1.5 Mhz to 30 Mhz (execpt for the IF frequency area) without additional crystals.
Pepi if it were me I'd look for an R4C.

Hi Sean

Ok, I've read all the flames going on here regarding Amateur Electronic Supply, but I've got to say they do have the battery you want.

They don't carry the Kenwood version, but there is one (I don't remember the brand it's aftermarket, but it runs $64.00. They have them at their Orlando Florida store. The number there is: 1 (800) 327-1917, or if you're close enough, 1 (407) 894-3238.

I called in an order for a buddy here at work (no credit card), and they had at least one in stock there.

The sales guy WAS courteous, and very helpful.

Don:

I bought the Alinco 6M rig at Dayton this year. Have it installed in my truck. Works great whenever there is a band opening on 6. I'm in Texas and have made contacts in Indiana, Ohio, North Carolina, and Virginia so far. Also have found several repeaters in Houston and elsewhere. Still waiting for a band opening to somewhere exotic though.

The rig is a little difficult to program mainly because I am a Yaesu believer for mobile rigs. The buttons work a bit different on the Alinco than the Yaesu.

I understand that Azden also makes a 6m FM mobile rig that has more than 10w output power. That's about all I know about it though.

Some repeaters use a standard easy access to emergency calls. Sometimes is
common knowledge or a shared secret. What I would try is:

Dial 911
or
Dial *9 (star 9)

Either of those may get you into the 911 system.

To bring the repeater down press the "pound" key (#), else let the
repeater time out.

:>The prices quoted were on par with AES and HRO, but he whipped their
:>shipping costs hand down.

How? Did he pay YOU to have your purchases shipped to you? ;-)

I know HRO does not charge shipping for orders over $100.00 and $4.50
for orders less than $100.00. Howsome ever if you choose to have your
purchases shipped via any other method than UPS Ground (Brown Label)
you will be charged whatever the actual shipping charge is based upon
the weight of your purchase. How do they do compute that? Via UPS
charts, USPS guides, telephone calls to the applicable shipping
agencies etc., and, of course, calibrated scales.

Also, if you choose COD there is a $5.00 charge for that added to
whatever the UPS shipping charge is (if any).

:>I have never really gotten a good grasp on shipping charges. More to the
:>point, if UPS charges $7.50 shipping, why does A charge $25 and B charge $15
:>when both are in the same zone?

Are both packages identical? I mean do they weigh the same? Is the
shipping method the same? Did A ship Blue label to a customer whilst
B shipped Brown label? Did one ship COD to the customer whilst the
other order was shipped pre-paid?

I'm not familiar with the other dealers since I only deal with HRO. I
would imagine that one dealer charges the actual UPS charge whereas
the other might charge for the time and labor for their own packers.
Only conjecture on my part.

:>It seems some companies are using "shipping charges" as profit
:>enhancers of sorts.

Who knows except the company themselves? Another thing to consider is
the company size and reputation. Of course, there is nothing wrong
with Radio City that I know of and you were talking of a period a
little over a year ago. But the information I gave is current and was
then.

Try the Icom IC-706 (not out yet in this country). Rumor has it that
it will be available next month* or so at roughly $1500.00 +/-.

HF + 6M 100 Watts (SSB/CW/AM/FM/RTTY)

2M 10 Watts (SSB/CW/RTTY/FM)
4 Watts (AM)

Receive Range 30 kHz - 200 MHz

See your favorite ham magazine for more details.

*Pending FCC Approval

I have seen in a ftp server a mod for the ft890sat
this mods provides an emmission in all the hf band without any hole.
I 'd like to trafic in 27Mhz (french citizen band) but i want to know
if anybody had done this mod and if it is ok
many thanks for your reply and best 73 from f1tyn

387. Is it possible to mod a Kenwood TH-F48 into the equivalent of a TH-48A?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-08-09 00:00:00 UTC
From: mcdonld@ix.netcom.com
Message-ID: <40b8ea$mag@ixnews3.ix.netcom.com>
Source record: 214101

For those who don't know, the TH-F48 is the version of this HT targeted for the Japanese amateur market. I may have the model number wrong, but its specs and number were similar to the TH-48A (TX/RX in 70cm band, RX only in 2m band). I am asking for a friend and don't have the radio with me.

My (non-ham but interested in ham radio) friend got one of these from a friend traveling from Japan. The problem with this unit is it only RX/TX 430.00 to 439.99 MHz. Obviously it would be more useful in the US if it could also RX/TX 440.00 to 449.99 MHz, like the 48A does.

Thanks in advance.

Subject: Millen Xfmrs & other parts

With all the recent discussion regarding the building of "minimum" transmitters, I have gone back to some books I studied in preparation to obtaining my Amateur Radio License. In the 1953 edition of "How to become a Radio Amateur", page 25, there is a four tube superheterodyne radio that I was planning on building back in 1953. The spark has been lit again and I just have to build this radio. I need to find a few components though. If I could obtain the I.F. transformers specified in the construction article, I I can complete construction of this radio. The parts I need are made by the "James Millen" company out of Massachusetts. The parts are:

1500-1600 kc I.F. Transformer, Millen part number 64161
1500-1600 kc BFO Unit, Millen part number 65163
1700 kc I.F. Transformer, Millen part number 62161
Horizontal Oscillator Coil, R.C.A. part number 205R1
Slug Tuned Coil Form, National Radio part number XR-50
Mini-Inductor, Barker & Williamson part number 3008

In the same book, on page 33, there is an excellent 2 tube transmitter that is a companion unit to the receiver. It uses a 6AG7 to a 6L6 to run 30 watts input on 80 & 40 meters. I would like to build that unit also. The only parts I need for the transmitter are the plate coils. They are made by "Bud" and their part numbers are:

BUD OEL-80
BUD-OEL-40
BUD-OEL-20

Some how this station never got built and I think that it would be great fun to complete the project I set out for myself over 40 years ago. Any help you Boat Anchor lovers can provide me, in this personal quest of the Golden Grail, will be greatly appreciated.

Thanks for your help,

Bob, ARS K7NWB

Message-ID: <jbeens.3.0013C164@silver.sdsmt.edu>
Source record: 213957

Hello all!
I am new to the tech-plus class and I am looking for a 2 Meter HT, or maybe a mobile rig to mount in my truck. I am attending college now, and do not have a lot of extra cash to spend on such an item. The limit of my price range runs about $200. What would be the best rig for the money that I want to spend. I do some interstate traveling, and may be in some areas where I need more power than an HT to hit the area repeater. I would like to hear some suggestions on where to look, or what to look for, in either style of radio.

Thank you;
73's

For what it's worth, you can get some excellent used HF rigs for the same price as the TenTec Scout with more features. I paid $325 for a used Icom IC-701, which is a fairly nice solid-state rig with digital display and 100W output. This rig is 1970s vintage but is a good starter. A friend started with an Icom IC-720A. which is an even nicer and newer model rig. He recently sold his IC-720 and bought a very nice IC-735 for about $500 to $600.

397. Yaesu FT-890 mods

Newsgroup: rec.radio.amateur.equipment
Date: 1995-08-10 00:00:00 UTC
From: MUENZLERK@uthscsa.edu
Message-ID: <01HTWKCH2IXU001GUU@uthscsa.edu>
Source record: 213961

YAESU FT890/AT mod. TX 1,5 to 30 MHZ.
==========

- Disconnect FT890 from all connections.

- Open tranceiver like explained in your "OPERATING MANUAL".

- Locate on the "CONTROL UNIT" jumper point JW 3001 and close it with solder.

- Close tranceiver back and reconnect power.

- Push PROC, AGC-F, IPO, ATT while power ON.

- Now the display shows two digits of numbers and tree of letters (i.e 13 OFF)
Rotate main knob and set the display to "02 ON". Now press the PROC button.

- Power OFF and then back ON. It's all!

- Now every time you want, you can change the programation, but you will allways lose the memories.

- Other settings than "02 ON" are of no interest. This one give you 100 w and automatic antenna tuning between 1,5 and 30 mhz.

==========

I found this on one of the newgroups a few months ago. I haven't tried it proceed at your own risk.

I've had an 8500 installed in my wife's car
for about a month now. I have mixed feelings
about the unit.

Things I like: internal duplexer, lighted keypad,
one hand programming.

Things I don't like: banked memories, lack of
automatic sub band mute, display contrast,
inconvenient access to autodial memories.

Performance so far seems fine, but like I said,
only one month of use.

My wife likes the controls on the mic, I feel like
I'm changing the volume or squelch every time I grab
the mic.

If it was just me making the decision, after what I know
now, I would have got another Tm733A if the 733A
had a lighted keypad.

>
>Which one do you think is a better choice ?

Both are excellent radios. I'd go with the 735, however, because it has a very long production history behind it (longest in-production HF transceiver), which tells you lots of people thought very highly of it. I still do. The receiver is very good, and the transmitter thermal control system is excellent, allowing long keydown periods without getting hot.

Why would you use a number like a drivers license??!?!?!?!?!

Your Call is the only one of its kind in the world! I have my call
permanently engraved in the metal case of my Kenwood TH79A(D).

I would recommend that people use this number, and with all the access to
calls, by QRZ and such it would be a fast and easy way to locate the
owner worldwide.

Now this only works if someone wants to return it to you anyway.

I'll bet you'd love a 'reliable' TRS-80 Model 1 as well, wouldn't you?
It uses a 'proven' microprocessor and stores data on that bastion of reliability,
the cassette deck.

Don't know if the Amateur dealers are doing this, but other companies sure are. A few years ago I ordered some non-Ham parts from a company several states away. What arrived was not what I had ordered, and the items I wanted were not in stock. The company refused to offer a refund, but I had paid over the phone with a credit card so I shipped the items back, then called the card company for a credit.

What I didn't know was that when card companies issue a credit on returned merchandise, they are obligated to do so for everything except shipping charges. Because of this, I ended up in an argument with the credit card folks concerning the difference between shipping charges, and "shipping and handling". The vendor was claiming that shipping/handling charges should not be refunded, and their invoice showed this item at about $30.00. However, the carrier's tag on the carton showed actual shipping charges to be about $7.00. To make this short, I won the argument and received the credit, but only because I had proof of the actual shipping charges.

The moral is, "shipping and handling" can be practically any amount the seller wants it to be. It may be a long ways from actual shipping charges, and this is a good thing to remember if there's a dispute later. Even if the merchant won't refund handling charges, the credit card company will.

There's also something to be said for having UPS (or your favorite carrier) pick up the shipment on *your* behalf instead of the seller's. That way, you pay shipping directly to the carrier and the exact amount is never in dispute.

>Dave Baker
>
Here's what I have:
Regency Communications, Inc.
Programming Instructions for Regency 250
1) Make sure that jumper JU401 has not been cut.
2) Turn the unit on.
3) Press Pro. Prior.
4) Press 0-all reference to 0 corresponds to 10 on the key board.
5) Press The six digits of the receive frequency (this is also the transmit
frequency if this is a simplex frequency; i.e. 151.625 or
154.000).
6) Press 0 for simplex.
8 for half duplex.
7) Press 4 for Tx disable.
2 for CTCSS encode only.
OR
0 for normal transmit and receive operation.
8) The next digits determine CTCSS frequency. For no CTCSS press 00.
01=067.0 02=071.9 03=074.4 04=077.0 05=079.7
06=082.5 07=085.4 08=088.5 09=091.5 10=094.8
11=097.4 12=100.0 13=103.5 14=107.2 15=110.9
16=114.8 17=118.8 18=123.0 19=127.3 20=131.8
21=136.5 22=141.3 23=146.2 24=151.4 25=156.7
26=162.2 27=167.9 28=173.8 29=179.9 30=186.2
31=192.8 32=203.5 33=210.7 34=218.1 35=225.7
36=233.6 37=241.8
9) If simplex was chosen, go to step 10. If half duplex was chosen, enter the
six digit number of the transmit frequency.
10) Press Enter, then the channel number the frequency is to be stored in.
11) Press Manual, then the digit of the channel to review the channel.
12) For entering another channel, go back to step 5. If no other channels are
to be programmed, turn the unit off, then on. The unit will now be ready for
normal operation.
NOTE: Remove jumper JU401 after programming.

Hope this is what you are looking for,
Chris, N7RME

412. Heathkit Radios SB-303/SB-401 Info Needed

Newsgroup: rec.radio.amateur.equipment

JPS Communications makes the ANC-4 ($175) which eliminates local noise before the RX. It is not a DSP product, but works like a null steerer more or less. Match the noise level and shift the phase.

I do not have the information at hand, but you can purchase helments already
containing the mics and earphones from Racing Electronics. Look at the Racing
newsgroups, someone there will surely be able to fill you in. Ought to work
neat as the drivers use two way radios simular to amateur radios.

>Hugh Duff VA3TO Toronto
>
>I maintain 3 RC-850's, 3 RC-85's an RC-96 and a ACC DVR unit......

the manual on the RC-96 has no component placement diagram making it very
difficult to locate a defective component....

the RC-85 has an inherent problem related to the cpu restart/por circuit..

the RC-850 has a number of bugs relating to cpu clock noise turning up in
the wrong places and causing strange problems....

All of their controllers (but the RC-850 in particular) have really
sucky audio handling, distorting the waveforms that are sent into them...

the way that ACC simply parallels all of the audio in's and out's together
is poor, requiring either external distribution amps or lots of ground

loops and hum.....

they really respond well to lightening too.....(even when it's in another state) in other words...they are r e a l sensitive to lightening and surges....

any more questions ????

P.S. I have two of the Link communications controllers...they e a t the ACC controllers in durability, function and audio handling....

I have a lot of old stepper motors from old DECWriter salvage. etc.
I would love to use these, but I do not know the color combinations.

The two different types of motors have either of these color
wires combinations:

or
black red
yellow orange
-- yellow
red ------
gray green
brown
black

(Many of these stepper motors look piggy backed; -- some of the wires
comming out of the top motor, and some from the bottom.)

Is there a standard color coding for these wires? Any guesses?
I can sequence these motors with my computer, but I need a little
more info.

Any help gratefully appreciated!

I have a Galaxy 550 with power supply and remote vfo available
for someone who wants to check it out and give it to a novice
or other beginning ham. That is the small compact tube-type
hf rig with separate power supply. I acquired it recently
and have not had time to check it out. I plugged the power
supply into the rig and fired it up and everything seems to
work ok but the audio volume is extremely low. I didn't go
much beyond that. Let me know via E-Mail if you want it for
some newcommer to the hobby, not for resale however. It is
free just for picking it up. I live in Pasadena near the
beltway and Spencer highway.

I add a hearty 'amen' to this. I bought one in July of last year and
it has been one of the most valuable items in my shack. I use it on
everything from my Racal to R-390A to my Drake collection. I built a
patch panel so I could jumper it in and out to various receivers.

Plan to add another one soon.

My only disappointment was the failure to ever receive the upgrade
chip the company touted earlier in the year..... they dropped the
ball on that one badly and I do know some who got it but many who did
not .

A total of two connectors.

One connector is for 160 through 6 meters.

The other is for 2 meters.

Hell all. I have a Midland 70-154B commercial HT and I need to know
if the radio can be programmed using the 70-1080 programming unit. I
know that this unit is capable of programming the syntech II radios but I
am unsure about mine. Any help is appreciated.
Thanks
Jay

jbeens@silver.sdsmt.edu wrote:
: Hello all!
: I am new to the tech-plus class and I am looking for a 2 Meter HT, or maybe a
: mobile rig to mount in my truck. I am attending college now, and do not have
: a lot of extra cash to spend on such an item. The limit of my price range
: runs about $200. What would be the best rig for the money that I want to
: spend. I do some interstate traveling, and may be in some areas where I need
: more power than an HT to hit the area repeater. I would like to hear some
: suggestions on where to look, or what to look for, in either style of radio.

In your price range, you probably want to consider a second-hand unit. A new 2m HT will set you back $250 or more, depending on the number of "bells and whistles" you want, and a mobile will run even more. A local ham-fest is a great place to shop, and many dealers also take trade-ins and sell the used ones they take in this way. Naturally, you shouldn't buy any used equipment without examining it carefully. If you go with a used "rig", try to get a knowledgeable "older" ham you trust to help you evaluate the ones you're considering.

In case that's not an option, here are a few things to look for from someone who was in your situation a mere 5 months ago, FWIW. (All these suggestions are based on the premise that this'll be your only "rig" for a while.)

I'd get an HT because of the greater portability. You'll sacrifice a few features and a lot of power, but you'll find more opportunites to use the thing, unless you spend a LOT of time in your truck. In regard to power, I'm finding that a good antenna is more important than lots of watts when you're transmitting, which brings me to

Antennas (plural intentional). Get a good one for your truck and buy or build another for home use, then don't use the "rubber duckie" unless you're afoot. In fact, you wouldn't go wrong to get an aftermarket telescoping one for this purpose. I've used an ANLI 800 on my HT in a QSO where the repeater was over 60 miles away. We were "full quieting" both directions event though I was only running a couple of watts.

Given the multiple antenna scenario above, you'll be changing feed lines often and should, therefore, try to determine that the connector is as well-secured as possible to the body of the unit. Also, be careful when switching and position the HT so the feed line isn't exerting any pressure on the connector. A good way to accomplish this is to get an external PTT speaker/microphone. An external earphone is also handy.

Also, get an additional battery. Longer life is probably better than higher voltage unless you'll often be on foot in "fringe" areas where it's harder to "hit" a repeater. It's a good idea to find some way of

charging one battery by itself (detached from the HT) while you're using the other. My HT came with a "stand" charger that services both my batteries. A cigarette-lighter adapter for the car and a "wall-wart" AC adapter for the house round out the power package nicely.

Naturally, all these things cost money, and you'll probably use up most (if not ALL) of your $200 budget just on the HT. You can use the above items as a "shopping list" to give to friends and relatives; that way, they'll know what to get you for birthdays/Christmas/graduation/etc. ;-) Since your immediate concern will be with the transceiver itself, here are a few features to look for (categorizations are, of course, "IMHO"):

MUST-HAVE: DTMF keypad (for telephone "patch"), CTCSS (aka "PL" tone) encode, back-lit display, ability to store several (10 or more) sets of frequency/offset/PL-tone for different repeaters, memory-scan mode to search these, high/low power output setting, QUALITY CONSTRUCTION

NICE-TO-HAVE: signal-strength meter, backlit keypad, out-of-band receive (for listening to other ham band and/or police/fire/ambulance/weather/etc), priority "call channel"

CAN-LIVE-WITHOUT: DTMF/CTCSS decode, auto power-off, aviation/MARS/CAP receive (unless you're military and/or a pilot), more than 25 "channels" (frequency/offset/PL combinations), DTMF memories (like auto-dial on a telephone)

If you decide on a mobile (in-car) "rig", I'd put repeat, remote operation, simultaneous dual-frequency receive, remote faceplate, and a clock in the CAN-LIVE-WITHOUT category (for your first one, at any rate).

433. REQ help with Motorola HT-600

Newsgroup: rec.radio.amateur.equipment
Date: 1995-08-10 00:00:00 UTC
From: mikek@deltanet.com
Message-ID: <40dgnb$n4s@news1.deltanet.com>
Source record: 214051

I posted here for lack of a better group. I have a Motorola HT-600
(model H44SVU7120CN) with 2 Channels. It has a 6 position channel switch.
(I took the cap off of the switch and there is a piece of metal that
stops the knob from rotating to the other 4 positions) My software will
let me program 6 channels after reading this radio....
My Question:

Is there a way to expand the radio to 6 channels?

(It repeats ch 1 & 2 if you rotate the switch now.
i.e. F1=1 F2=2 F3=1 F4=2 F5=1 F6=2)

Please respond via email to mikek@deltanet.com thanks

Hello,

I have just acquired an Icom IC2SA 2m handheld rig. It is in full working order but it seems to lack a toneburst. I understand that there are many mods for this little set and I would be most grateful for any details you may have. As I live in England, the version of the set imported here was the IC2SE-does anyone know how to convert the 2SA into the 2SE?

Many thanks,

Al Bolton.

444. RE: *** STOLEN RADIO *** ENGRAVING service

Newsgroup: rec.radio.amateur.equipment
Date: 1995-08-11 00:00:00 UTC
From: Michael.Black@juxta.mba.org
Message-ID: <793_9508111730@mba.mba.org>
Source record: 213912

randyrho@drycas.club.cc.cmu.edu offered to engrave
"HTs clip or removable plastic anything" for a dollar
plus shipping.

The problem with this is right there in the ability to do
this. If you can remove the clip or anything to send away
for engraving, then it's not too useful. The thief can
always remove the item and claim "it was lost". You want
any identifying mark to be engraved in an integral part of the
unit.

It's probably worth engraving any piece of equipment twice.
Inside in a more or less hidden location where you can use it
to reclaim it should it ever get stolen and then recoverd.

Then also engrave it in a very obvious place where someone will
look when examining it should it get stolen. For the honest,
an identifying mark that the seller can't explain away (with
a bill of sale from the original owner, for instance) would be
a warning that the thing is probably stolen. It might also lead
that honest person to contact authorities about the possibly stolen
rig.

By the way, around here the police department will engrave an
identifying mark in a piece of equipment that you want marked.
I can't remember if you just have to drop by a police station,
or if you have to watch for when they have some sort of drive.
It might be worth looking into this in your area. If the police
don't do it, maybe some other community organization has such a program,
or simply has an engraver that you can use. Perhaps even an
insurance company would do it, since it's in their favour to
keep theft down.

Source record: 213913

joe@westonia.com (Joseph Cooper) wants information on
converting the FT101B's 11 meter position to 17 meters,
and allowing for transmitting on the WWV (10MHz) position
for 30 Meters.

Check 73 Magazine from about a decade ago. I know there
was an article in there for converting the FT101 for some
of the new bands. I can't remember if it included the 30
meter conversion, or simply mentioned that it had been
described already, but I do think it mentioned converting
the 11meter position to 17 meters.

I'd say it was around '85 or '86, but sorry to say I'm
not sure of the exact details. I do know it was in 73
and it was around that time.

Similar mods might have been described in the Hints and
Kinks column in QST. I never saw such a thing, but it
is the sort of thing that would show up in that column.

Find someone or some place (a library? a ham with a good
and organized collection of ham ma

Find someone or some place (a library? a ham club?) with a
good and organized (unlike mine) collection of ham magazines,
and start looking through the annual index at the end of the year.

I hope this is a start.

By the way, when the FT101 came out, 11 meters had not been a ham
band in the US for over a decade. Here in Canada, most of it
had been allocated to CB like in the US, but maybe three channels
worth (I think at the low end) were kept as a ham band, though I
doubt anyone used it at that point. It was still in the books
as late as 1972. It was eliminated at the same time as they
dropped the requirement that you be 15 years or older to get a
ham license here in Canada. I got my license two months after
that change, when I was twelve.

[Author was Michael Cowart]
[Posted on 11 Aug 1995 15:19:00 GMT]

I don't know if this qualifies as an antique, but I have acquired
a Hammurland HQ-145. HELP -- I need the manual! Is there some
kind soul that can send me a photocopy? Will pay for copying and
postage.

ALSO, what is this receiver worth? It is in GOOD condition, no scratches
on the front panel and the usual nicks in the cabinet -- VERY clean.
It has a FUNCTIONAL clock. The unit works well.

any info would be appreciated, especially the manual :)

thanks

: Subject: Handheld speaker mics? Yaesu? Generic?

I have a Yaesu speaker mike for my FT728 (Japanese domestic model FT 470, no idea how it got to Australia!). I have friends who have near identical copies, MFJ I think.
The main difference is in the stiffness of the coiled cable!
If I drop mine it hits the floor, my friends don't fall that far because the cable is stiffer.
This seems to be the only difference, and seems to me to be a good reason to buy the MFJ item, which is about half the price of the Yaesu mike here in AUS. (got mine second hand with the radio)

> recommendations for deep storage 12 volt batteries. Let me know.
Well, I have a pair of InterState Batteries, don't recall the model,
that are marine duty cycle deep discharge batteries that produce 1300
cold cranking amps (if I recall, that is equivalent to drawing 1300
amps for 30 seconds before a single cell drops below .9V or the entire
voltage drops below 10.?

The bloody things are huge, but they are rated to produce 30 amperes
for 650 minutes (10 hours and 50 minutes) from a full charge... Takes
a while to shove that many electrons in there, but they keep my Unix
system up when the Lectric Company is on "holiday"

>
> Hugh Duff VA3TO Toronto
>

Tho't you might be interested in an impartial observation; my only personal objection to the ACC controllers is that they are expensive - for what they do, to fix, and to upgrade. But, anyway...

Three of our club's (high profile) repeaters rely on RC-85 controllers. Over the past several years we've had a series of failures which lead me to believe that there is a certain lack of robustness in the design. The most problematic areas relate to the audio chain, and particularly the DVR (digital voice recorder). The codec chips are especially fragile, and are difficult to find from sources other than ACC, who wants a comparative King's Ransom for the parts.

In the eyes of our user base, we are constantly having to apologize for system failures. The mailbox feature of the DVR hasn't been used in months because of the reliability problems as well as access complexity; people got tired of messages lost either through miskeying a code or DVR glitch. As a control op on these machines, at least once every two months I have to keep notes with my code sheet which detail whatever workaround is in effect to deal with one failure or another. Also, three or four times a year it "dumps" the library of prerecorded messages, and we have to reload the whole mess.

Our systems are maintained by professional radio technicians. I estimate that 90% of their maintenance time is spent on controller issues. Another club I belong to uses a Hamtronics controller on their repeater, and, as a comparison during the same period, has had *no* controller failures. And, personally, I would not have made a Hamtronics controller my first choice.

ACC controllers are doubtless capable and feature-rich. However, the track record from my limited experience with them is not very positive.

FWIW.

450. Re: 2m radio advice sought...

Newsgroup: rec.radio.amateur.equipment
Date: 1995-08-11 00:00:00 UTC
From: 917461@bud.swin.edu.au
Message-ID: <40fu6t$j5e@lucy.swin.edu.au>
Source record: 213918

Judging from the FT 530 advertised for $350 your prices are a bit different to ours in AUS, but I'll assume that you have 6/7 x what a 530 costs in AUS...

What do you want?
A spare battery pack is very useful.
A charger, ideally fast is essential.
A 12V adapter and speaker mike help use in a car, along with a magnetic base antenna, but don't expect wonders.
Scanning is useful, as are memories.
Battery saving functions (listen for 100ms, turn off for 900ms) is worthwhile.
In Australia DTMF and Tone squelch are not terribly useful, this may be different for you.

I am only familiar with the Yaesu range.
The FT 207 is a dinosaur with a LED display and 4 memories.
The FT 208 is the same with LCD display.

The FT 203 is a basic compact thumbwheel tuning handheld, with vox, from the mid 1980's
The FT 209 is a keyboard operated, scanning, multiple memory, battery save etc unit, same generation as the 209 with matching accesoriesand battery to the 203.
(FT709 is 70cm version)

The FT 23 is the next generation basic unit, not very many memories etc. (FT 73 on 70cm)
The FT 411 is the more sophisticated unit of the same generation, battery etc match FT 23, features similar to 209.(FT 711, I think)
FT 470 is dual band 2m/70cm version of 411, without vox.(also called FT728 with 800 - 950 Mhz recieve)

Next generation was FT 415 (similar to 411), FT 25 (I think) (similar to 23) and FT 530, similar to the FT 470. By the time these appeared I owned a FT 728 (apparently the Japanese domestic version of the FT 470, I've no idea how mine got to australia, I've never seen another one) which I am listening to as I type.

My guess is you can probably afford a 411, a 415 or a 470. Plenty of mods for extended transmit/recieve are available for the 470. I don't know what your interest in 70cm is, or even if you are licensed for 70, but I am perfectly happy with my FT 728 (FT 470 equivilent)

BTW, my first radio was a portable FM/SSB FT 290 about the size of a car radio, with nicads. It was simply too big to cart around and too low

power to be really useful at home. It is now connected to an amp at home and operated off mains via a power supply.

451. Re: Azden 6m handheld. Opinions?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-08-11 00:00:00 UTC
From: kevin.jessup@mail.mei.com
Message-ID: <kevin.jessup.778.009DCBD5@mail.mei.com>
Source record: 213919

In article <3vkntp$m4e@news.wco.com> km6xu@wco.com (Mark Walsh) writes:

>If you want a six meter FM handheld, you really don't have a choice.
>Regarding my AZ-61, my thoughts are:

I had the AZ-21A, the 2-meter equivalent of the AZ-61.
Mechanically, they are almost identical.

>Pluses:
>This unit is built more like a commercial radio than an amateur radio.

That was my hope. I bought two AZ21 units. I sold both. Both
eventually went back to the factory for repairs. Under warranty
and free, at least.

One periodically lost all audio. A poor solder joint or something.
The other would periodically lose all memory. It wasn't the backup
battery. They just gave me a new (I wonder) unit.

I heard good stuff from some people on Azden's quality and the
unit sure LOOKED tough. I thought the first one was maybe one
of those rare lemons so I gave 'em one more shot. Sorry Azden,
two strikes and you're out. BTW, I never dropped or abused
my units.

>The volume and squelch controls have both good range and feel nice.

Yes, but I found the audio poor for a unit it's size. A $220 Alinco
DJ180T will kick-ass audio-wise compared to the Azden. The
Radio Shack HTX202 also.

>The seals around the two buttons are almost too good.

This I agree with. The seal job is excellent. There's a full
rubber gasket underneath the switches. The switch "rods"
actually push down on the gasket so as to make mechanical
contact with the actual switches on the other side.

>It seems to go a long time on a battery.

But there was no low battery warning of any kind on the AZ-21.
It just goes dead without warning. Better have a spare handy
all the time.

>My Yaesu speaker mic works fine with it.

Actually, Azden makes a fantastic "waterproof" speaker mike.
And it worked great on my Alinco HT too. The Azden speaker-
mike provided better (and louder) audio then the Azden HT itself!

>It's American, gosh dang it!

No. Azden is made by the Japan Piezo company.
Doesn't it say that on the back!? Their US sales
and support office is out East.

>Minuses:
>The user interface absolutely sucks! I've crashed its software twice.

It's bad, but you get the hang of it. And it is almost imposible to
QUICKLY change PL tones and offsets while in VFO mode. It's
kind of a "program it and forget it" radio. Set it up the way you
want (painful) and hope you never have to change anything.
And you better lock that manual (crappy as it is) away in a safe! ;-)

I think the user-interface was programmed by a non-ham,
non-RF-aware computer science major fresh out of school
using an assembly language he never used before. Maybe
even by a co-op student as a sort of summer project ;-))

>The only battery available is a 12V 600mA that is compatible with nothing.
>The only battery charger available is its geeky "five hour" stand.

I easily hacked their supplied battery stand into my W&W associates
microprocessor based rapid charger. Works great.

Mechanically, the Azdens are built like tanks. But IMO, their
circuit board fabrication and software are BAD.

Anyway, Azden is your only choice for an amateur 6-meter HT.
Good luck.

452. New Ham Radio Test Software - Macintosh

Newsgroup: rec.radio.amateur.equipment
Date: 1995-08-11 00:00:00 UTC
From: john@wd1v.mv.com
Message-ID: <john-1108951714240001@wd1v.mv.com>
Source record: 213920

The new Macintosh Ham Test Simulators are HERE!

Novice Ham Test 5.0 SA.sea
Technician Ham Test 5.0 SA.sea
General Ham Test 5.0 SA.sea
Advanced Ham Test 5.0 SA.sea
Extra Ham Test 5.0 SA.sea

The latest versions feature:

HyperCard 2.3 as a stand-alone application (SA) eliminating
the need to have HyperCard. All you need is a Mac with 4
Meg of memory and version System 7 or greater.

Each version 5 Ham Test Simulator has the latest questions
as prepared by the Question Pool Committee.

Each Ham Test Simulator is FREE OF CHARGE and work the
same way as the originals written by Diana, KC1SP.

You may obtain a Ham Test Simulator by mailing me a *FORMATTED
disk (1 per test) and include a Self Addressed and Stamped disk
mailer for the return.

The Ham Tests are now also available via America On Line.

Each Ham Test Simulator is also bundled with a shareware CW
program called MacMorse 1.4 written by Doug, WB0EON.

Also included are a collection of text files that relate an
interesting variety of ideas about the best way to study CW and
prepare for tests.

If you load these onto file servers where others can gain access
via Internet, please let me know so we can point others in that
direction.

Your comments and suggestions for future versions are always
welcome. Stay in touch and good luck with your next test!

73,

453. Re: Standard C508A Dual Band Micro HT

Newsgroup: rec.radio.amateur.equipment
Date: 1995-08-11 00:00:00 UTC
From: gary@ke4zv.atl.ga.us
Message-ID: <1995Aug11.135232.7096@ke4zv.atl.ga.us>
Source record: 213921

In article <40ba1l$do6@newsbf02.news.aol.com> nepaleduc@aol.com (Nepal educ) writes:
>Has anyone any experience with this new HT? Looks like a nice extension
>of the C108A to include both 2m and 70cm, all in about 5 ounces!

I've got one, it's a nice little toy. Batteries last a *long* time
(uses a pair of AA). Audio quality is surprisingly good. The 1/4 watt
transmit won't hit any repeaters from my location with the included
antenna, but it hears plenty of them. Comet has a new antenna, the
SMA-3 that's made for this radio, and it improves range nicely, though
at 15 inches long it sort of defeats the purpose of the tiny radio.
I find the rig most useful as a wireless microphone for my dualbander
mobile rig.

There is no touchtone pad, and the operating controls are slightly
confusing at first. You need to read the really bad manual several
times to find out all the tricks (lots) that this rig will do. Aside
from no TT pad, the only other drawback I see is that the rig won't
operate true dual band, IE you can only operate on one band at a
time. That's a problem if you like to use a mobile rig in crossband
to enhance your transmitted signal, but receive directly on the HT.

The rig has two call channels, one each on 2m and 70cm, and 60
channel memories that can be mixed in any order regardless of
the band switch setting, IE you can have alternating 2m and 70cm
frequencies stored and can use them without regard for the position
of the band switch. The band switch only affects the VFOs and
the call channels. CTCSS encode/decode are built in, and repeater
splits can be programmed standard or odd, and stored with each memory
channel. You can lock PTT or the frequency from the setup menu, so
you won't accidentally transmit or change frequencies while carrying
it around. There's a nice LED illuminator for the LCD display that
is genuinely useful in the dark. (In fact it's bright enough to
use as an emergency flashlight.)

The squelch is very unusual. The noise squelch is fixed. There's no
way to adjust it externally. The factory adjustment seems to work well
however. There is an alternate signal level squelch that is adjustable,
working off the S meter. I haven't found a use for that yet. And of
course, you can use CTCSS decode squelch. There's a monitor button which
forces the squelch to open. When in repeater split mode, pushing monitor
flips to the input frequency, when in simplex mode it just opens the
squelch. Monitor is momentary unless you hold down the function button
while hitting monitor, then it locks the squelch open until you hit the
monitor button again. (A nice touch.)

There are 10 programmed limit scan memories, plus band scanning, selected 1 MHz scanning, all scan, and memory scan. And there are three different scan stop modes, hold, busy hold, and timed. Step rate is programmable to all the usual steps. While the scan rate isn't particularly fast, it does stop on channel reliably. Sensitivity seems to be good, though the supplied antenna is only useful in the 2m and 70cm bands. A different antenna works much better when listening outside those bands. There is an AM detector which can be set to automatic or manual. The unit covers from 110-200, 300-400, 400-520, and 700-900 MHz (cellular locked out, however image rejection is non-existant on this band so the lockout is rather moot). The extreme limits of each band aren't usable because the PLL comes unlocked at the band edges.

I haven't yet taken it to a high RF area to check intermod. At my rural location, and on just a whip, no intermod has been noted. Used on an outside antenna, or in a high intermod area, that may not be the case.

There are the usual mods for out of band transmit and for unlocking cellular (though the latter is moot as noted). These are accomplished by removing two microscopic zero ohm surface mount jumpers internally and resetting the CPU.

An optional NiCad pack is available, but since alkalines last so long I don't think many people will bother with that. There is also an optional speaker/mike, but with the radio's small size that hardly seems worthwhile either. It does use the standard Icom/Yaesu double plug arangement so those speaker/mikes, headsets, and *packet* cables will work. Adding a PacComm PicoPacket and a HP200 (or similar palmtop) makes a tiny pocket portable packet station. I haven't tried to make it work at 9600 baud yet, but I'm doubtful it will work at that speed without further modifications. Most rigs won't.

The major downside to this radio is that the manual *really* *really* sucks. You'll find yourself learning how it works more by experimentation than from the manual. No schematics are included, though there is a block diagram, and there are no board layouts either (which would be *really* helpful). I don't know if there is a service manual in English available yet, but one would be welcomed. One other note, the antenna connector is SMA. If you intend to use an external antenna, be sure to pick up a SMA to BNC adaptor. I'm not sure how well the radio will stand added mechanical loads to the antenna connector, however, so I'd advise caution here.

>
> Whew! So, I'm not the only one whose noticed this.
Hmmmm. Just a guess, but are ya'll trying to use a non-windows version
of SuperMorse with your S/B card to produce a nice note under a DOS
window? If so, *THAT* is your problem... it has nothing to do with the
program, which works quite well, UNDER DOS, but WINDOZE has some
really excentric ways of doing things that get in the way of the
SuperMorse code and bugger up the sound...

If isn't a problem with the program or the S/B card, it is BILL GATES,
the man who said "640K ought to be enough memory for anyone..." and
then proceeded to produce WinDoze.... ;^)

The instruction sheets for SuperMorse are pretty good at calibrating
things and for making the note sound OK... Tghen again, I do my CW
mobile, so road noise covers loads of mistakes! ;^)

I have owned the az61 for about 9 months i loaned it to a friend for 3 months and talked to him while he drove around with it most days. It has excellent audio. it works very well with a good antenna. We used the radio shack 5/8 wave 2 meter mag mount on his car for an antenna with good results. we checked first and the mfj 259 gave it a 1.5 to 1 swr. The larsen had a higher swr so we did not use it. he ran a halo with 230 feet of hardline from the house 30 ft up in the air. The surprise for me was the simplex range with 5 watts. In short it is a nice little radio for which they finally produced a real manual. It is extremely complex to program.

457. ICOM IC-2AT info needed

Hello All.....

I picked up an ICOM IC-2AT at a hamfest last weekend which has a transmit problem. My problem is that I don't have the manual/schematic diagram and the previous owner changed the driver and output transistors with ones with no part numbers on them.

Can anyone tell me what the orginal numbers are for the driver and output transistors on the IC-2AT ? I would also be glad to pay the costs for a copy of the manual / schematic diagram if anyone has one they can copy.

Thanks in advance

<deletia>

Don't knock the controller for problems with the DVR. I've been using an
RC-85 with no DVR for about 6 years without a single problem.

The MLA2500 had 10 Meters built in, while the MLA2500B came out after the FCC decided that the
best way to curb the use of Ham amps on the 11 Meter band was to take make the manufacturers
remove the 10 Meter band capability. Ya gotta love the way the government protects us! The MLA2500/2500B was a very good amp that took very little drive to produce lotsa RF. The amps had three weak points that come to mind, noisy fan, poor power supply design, and very expensive tubes!

Hmmm...Our club has been running an RC-85 for about 8 years now...
No sensitivity to lightening...It's up about 27 stories with other
components that have taken hits...no problem with the '85.
Never had a problem with restarts after black/brownouts...seems to
recover just fine. I admit that the simple reset circuit is not high tech
in design but we have experienced no such problems with it.
Same goes for the op-amp arrangement in the audio circuitry. I don't see
that the way in which they've paralleled the inputs via op-amps presents
a problem. I will say that the controller does have quite the processed
sound to it though...never any problem with hum...perhaps you have a
ground loop or supply problem !?
Our RC-85 "takes a lickin' and keeps on tickin' ". Sorry to hear about your
hardships with ACC.

Funny that you are stuck on the Link Com. units...we recently installed
one and IT is in fact experiencing restart problems ! I also note
firmware bugs with it albeit minor. It occasionally forgets to courtesy
beep (?). We are running 2 repeaters from it.

I have the EX-106 optional FM board for an Icom IC-551 6 meter rig.
I am aware that they are as rare as hens teeth...accepting 'attractive'
offers.

Leave a reply with an offer to: hduff@humnet.humberc.on.ca

462. 2 Meter + Business VHF

Newsgroup: rec.radio.amateur.equipment
Date: 1995-08-11 00:00:00 UTC
From: pmalenfa@kitkat.webo.dg.com
Message-ID: <1995Aug11.173537.25538@us.dg.com>
Source record: 213930

Does anyone know of a 2 Meter portable radio that is capable of
tx/rx on the frequencies used by the business VHF transceivers?
I believe the business ones go from 152-158 MHz.
It seems like they are so close that people who are licensed for
both should be able to find a single unit that can do both.

Frank,
We can help you out on the Version 3 upgrade chip. It was delayed
several months from the planned delivery date, but we have shipped
thousands since this spring when we started delivering the chip.
Everyone who has ordered an upgrade should have one. If you want to order
an upgrade or check on the status of an upgrade order, call, FAX, mail
e-mail, or walk in with your DSP serial number, model number, and mailing
address and we will get you the necessary information to order the chip
(there are several variations depending upon the model and serial number).
Delivery is about two weeks.
We plan to have the upgrade info on our Web home page in a few weeks -
http://www.timewave.com. We also have a new e-mail address just going
online - dsp@timewave.com (effective by early next week).
Let me know if you have any questions or problems.

73,
Randy Gawtry K0CBH
Timewave

>Now this only works if someone wants to return it to you anyway.
The reason for engraving a driver's license number is because that's the
one thing the police can trace. Social inSecurity Numbers or amateur
calls are not of much use to the police. Of course, if another amateur
buys the thing, and wants to check its ownership, engraving the call
would work.

I'm not familiar with the radio Stefan mentions, `tho I expect he is
correct. The difficulty is in federal regulations. You can't get a license
to allow the use of amateur equipment outside of the bands for which the
equipment has been approved. In other words, the equipment itself must be
of an approved design (called Type Acceptance) to be used in a given band.
If you use amateur equipment out of band, you are violating the law. Most
of the amateur radios presently being made are capable of being modified to
transmit over a very wide range. Lot's of people make these mods. I'm
not telling you to do it or not do it. Just providing info.

Interesting...

The manager of the store that I shop at knows my name, so he doesn't ask anymore.

This means that either:

a. He has a good memory.
b. He doesn't have a very large customer base.
c. I spend entirely too much time at RS.
d. All of the above.

Oh well...

: who've had a problem with this (which is, I presume, why they've changed
: the system), but I really don't understand why. In my experience (from
: both sides of the counter), the information is optional anyway--if I
: didn't want to give it, that was acceptable. I guess what I don't
: understand is why people object to indexing the database by the last four
: digits of a phone number, but don't mind indexing by last name.

Phone numbers (particularly unlisted ones, as mine has always been) are
personal information. I don't want any "cold calls" at home, and don't have
time to be bothered at the office. If I want information, I initiate the
contact; the opposite is not acceptable.

In most areas, it doesn't take a rocket scientist to make a complete phone
number out of the suffix.

I would prefer that only my name and address were stored. That way, I can
discard any irrelevant material with all the other irrelevant material that
clogs my mailbox daily.

Often, I felt really sorry for the sales staff at RS. It's obvious that
many of them got a lot of flak just for asking for phone numbers.

Source record: 213986

I have a TM-733 just installed into my (n)used vehicle, with a
MANUAL transmisson. Having tried to make coherant conversation while city
driving, (and being either unsafe or un-readable), I would like to know
of a way to allow the VOX on my HS-51 (Icom) work to my TM-733.

I know that the Icom uses PTT and TX voice together, and Kenwood (allong
with most all other mobiles) use separate PTT and TXaudio.

Can I use the Headset directly, or does anyone know of a kit interface?

Thanks, Chris

I found this program under the name NM130.ZIP at:

oak.oakland.edu/pub/hamradio/arrl/bbs/vec/

BTW, this looks like an excellent program with a good Windoze interface.
I did notice one problem during a short trial run though. There's an
annoying click on the trailing edge of the elements with the Soundblaster
turned on. Anyone else notice this?

RESULT
unmoderated group rec.audio.tubes passes 263:24

There were 263 yes votes and 24 NO votes, for a total of 287 valid votes.
There were 3 abstains and 21 invalid ballots.

For group passage, YES votes must be at least 2/3 of all valid (YES and NO)
votes. There also must be at least 100 more YES votes than NO votes.

There is a five day discussion period after these results are posted. If no
serious allegations of voting irregularities are raised, the moderator of
news.announce.newgroups will create the group shortly thereafter.

rec.audio.tubes Final Vote Ack

481. WTB: Lapel Mic for Motorola HT600

Newsgroup: rec.radio.amateur.equipment
Date: 1995-08-11 00:00:00 UTC
From: davidf@alumni.EECS.Berkeley.EDU
Message-ID: <40gjon$826@alumni.EECS.Berkeley.EDU>
Source record: 213990
Cross-posted to: rec.radio.amateur.equipment,rec.radio.swap

I'm looking for a lapel mic to use at work with an old HT600... We've migrated to GE radios for work, but occasionally my unit goes down and I have to revert back to the Motorola and want a lapel mic to work with it. Doesn't have to look great, just has to work.

I'm in Southern California, but will be in Northern California quite a bit over the next month... Prefer something I could pick up, but I'll talk shipping if you've got the right price.

Thanks,

Dave Friedman

: Kind regards,

: Stefan

Nice try. The amateur radio equipment is NOT type accepted for use
in the commercial bands. For use in the commercial bands, the radios
MUST be type accepted. Guess your stuck with the higher priced spread

Most 2M rigs can be modified for the band you mentioned and will work
fine. Be aware though that these radios are not FCC type accepted for
that service and are illegal to use on it.

I am also interested in this question and in the general question of what tubes are used in other HF amps. Has anyone compiled a table or list of tubes used? I'm in the market for a used HF amp, but I know that some of the ones I see at Hamfests are "cheap" because the tubes they use are worth more than the rest of the amp! I know that the commercial tube vendors must have such a list since when someone calls and says "I have a Belchfire 9000 that needs tubes" they can respond with "Oh, you need 4 of the Megwatt VB3's, we have 'em in stock!"

If any HF amp owners care to respond, I'll compile a list and post it for others.

Thanks + 73

From: s9231498@cs.sun.ac.za
Message-ID: <40folu$94m@itu1.sun.ac.za>
Source record: 213996

Hi!

I am having trouble contacting The MA/COMM company. Does anybody know if they have a WWW page? I am looking for more information regarding their electronically tuneable "Gunnplexer" (as they call them) Gunn transceivers. It's for a 10Mbps wireless data link that I am busy constructing...

Thanks.

Unfortunately, you are NOT able to provide the type acceptance that is required to OPERATE the radio in the frequency range.

Type acceptance for the radios is required to ooperate them in the non-amateur portions of the bands. Part of type acceptance is that the radios are not user programable. (Typically why commercial radios were crytsal controlled or required programming sets).

Operating non-type accepted equipment is not worth the cost savings when compaired with the fines and confisication possiblities.

How many Police departments have a QRZ CD-ROM? The reason for
using your driver's license number is that police can easily trace
it if your property is recovered by them. This is also the reason
that Social Security numbers are not preferred, Police don't
have easy access to a SSN database. I'm not saying that you
shouldn't put your call on your equipment. If it should show up
at a hamfest, someone would identify it there. Just use it in
addition to your driver's license number..

The people most likely to find a stolen radio would be police, or possibly another ham. Hard to say which. Another ham could trace down a call, but the police would be clueless. On all my tools I have my driver license number, as recommended by police. They can trace that quickly and easily. I don't have anything on my ham equipment, but I'd be prone to putting BOTH on if I put one on. If you are going to engrave one number, you might as well engrave both. Then either the police or another ham can find you if you gear is stolen.

>My DISCONE is ok since it can do 200 watts. Would this AMP destroy
>my Jpole or somethimg else?

Transmitting ladder line is supposed to be able to handle a kilowatt,
I doubt you can harm it with 30 watts. However, if the VSWR of the
J-pole isn't good, you could toast the amp. Check the VSWR if you
haven't already. Don't depend on article dimensions to give a good
match. Your HT is designed to work into bad loads, just look at the
rubber dummy loads they come with, but the amp is likely to be more
particular.

Hello,
I have been using the Ft-900/AT for the last couple months. I have
ben very please with its performance. Before buying theFT-900/AT I
was using the FT-890/AT another great radio. I would recomend both
radios for mobile operations.

Cwave is a utility for Windows. If you have a shortwave radio and a Windows compatible sound card, Cwave will convert Morse Code into readable text, in real-time. No TNC or de-modulator is required.

Precise sampling and filtering of the incoming signal is provided, and the converted text is presented in a convenient text editor.

Cwave is shareware, and is available for file transfer at:
ftp.eskimo.com/u/p/pika/cwave

Thank you.

-Pika Software

>I would recommend that people use this number, and with all the access to
>calls, by QRZ and such it would be a fast and easy way to locate the
>owner worldwide.

>Now this only works if someone wants to return it to you anyway.

Fine. Let me give you a probable scenario:

You go to a restaurnay with your wife/girlfriend. Your car is broken
into and the mobile rig is stolen. The cops stop a guy across town an
hour later, and they find a half dozen CBs, car stereos and your mobile.
These cops run any serial number they can find, and the DL that was
engraved on a CB. One comes back hot, so they can now arrest the perp
for possesion of stolen property.

Frankly, I have yet to see a cop that even knows what a callsign is,
except as a funny sequence he sees on some license plates.

The local club had a cop in to give a talk on how NCIC worked, how
stolen property reports were processed, and how to maximize the chances
of getting your stuff back. I am sure that any agency would be happy
to do a simiar talk for a local club.

One tip from the talk: The computer does a hit on an _exact_ match.
If the number can be modified in any way it will prevent a hit, at which
point the cop assumes it's a cold radio. When you engrave your DL
number, DO NOT do it like this: CA DL X9999999. The perpetrator
can add a digit to the end. Yes, CA cops know what CA DL numbers
look like, but it's easy to take a load of hot stuff to Nevada
or Arizona and sell it at a swap meet there.

SO engrave the radio like this: CA-X999999-DL. Makes it a little harder to change the number.

Just make sure that when you sell the engraved radio you give the new owner a nice clear bill of sale, including mention of the engraving.

There's a number of after-market battery suppliers out there. Here's
contact info on two that I've dealt with:

Periphex, Inc., 115-1B Hurley Rd., Oxford, CT 06478, 800-634-8132,
203-264-3985, 203-262-6943 Fax

W&W Associates, 800 S. Broadway, Hicksville, NY 11801-5017, 800-221-0732,
516-942-0011, 516-942-1911 Fax

Both outfits make batteries for the 202/404, as well as a long list of
other radios. I've been pleased with what I've bought so far.

the root
>cause and possible fixes. 73's & GUD DX
>>
Hope I'm not restating the obvious here, but a couple of observations:

The Eimac manual for the 3-500Z states that the maximum permissible
temperature for the glass-to-metal seals is 200 degrees C. Since ordinary
solder (63/37 alloy) melts at 183 degrees C, if the tube is getting hot
enough to melt solder a fraction of an inch away, you may well be exceeding
the 200 C limit. I would suggest obtaining some temperature indicators such
as stick-on dots and checking the tube temperature under operating
conditions. If you're not exceeding 200 C, then most likely the original
problem was a poor, high-resistance solder joint which overheated due to
I-squared-R loss. If your repair was done properly, end of problem.

I'm getting ready to get my Tech ticket and have stumbled upon some equipment for sale which belonged to a gentleman who has recently passed on. My wife's uncle, a fellow ham, was an acquaintence of his and vouches for the fact that the equipment received the best care. I would like to ask if there is anyone familiar with these units who could give me sort of a "Consumer Reports" review of the pros/cons and estimated values of the equipment. Items and asking prices are:

1) Radio - Drake TR-4C - $300
2) Tuner - Drake MN2700 - $175
3) Amp - Heath Kit SB 200 (2kW) - $350
4) 2m Mobile - Kenwood TR 7400A - $250

I greatly appreciate any and all responses!

Jay

Message-ID: <40jpk9$3c7@ralph.vnet.net>
Source record: 213806

It may be a fair price. But the equipment is not state of the art,
Old as far I see it.
The Drake is maybe close to 15 to 20 years old.
So is most of the other stuff.
I'd hold out for newer equipment.
Solid state stuff as opposed to the Drake, Although a fine piece of
equipment.
This is only my opinion.
Good Luck.

523. GE MSTR II (converted -> RPTR) HELP?!!!

Newsgroup: rec.radio.amateur.equipment
Date: 1995-08-13 00:00:00 UTC
From: "Alan K. Adamson" <ne1h>
Message-ID: <40l5s9$bda@wa4mei.radio.org>
Source record: 213811
Cross-posted to: rec.radio.amateur.equipment,rec.radio.swap

All,

Yet another converted GE repeater question. Hope someone can shed some light on this one, as it is quite a mistery.

It has to do with the squelch circuit and how to get COS (or the switch to turn on the TX, when RX is active).

In the manual there is mention of a slow and fast squelch (The service man that is). If we look at the two outputs coming out of the RX, the CAS, and the RUS lines on the header block. Neither exhibits the 200ms of time delay that the slow squelch is suppost to deliver, all we can find is about 30ms. Now the compilcation is that if you are a week signal and you are picket-fencing, the 30ms is too short and you drop the TX on each picket fence. This can be quite anoying (sp?). To make matters worse, if you run an audio delay board to get rid of the squelch tail and DTMF bursts, you start to loose parts of words.

We have found no way to remedy this problem. I would like to know where others have pulled COS off for repeater use (btw, these are mobile radios, being converted), and if they have ever noticed this problem. Also if there is anyone out there that has the service manual for the real MSTR II RPTR and can look and see how they generate COS I would like to know that as well.

Hope someone can shed some light on this...

Thanks,
Alan Adamson

Actually so is Amateur Electronics Supply (aesham@execpc.com and
http://execpc.com/~aesham) so they might be listening to this thread
(actually probably are they loged in Sat the 12th and Monday the 7).

Although all I've done so far is to get price quotes, the web site isn't
worth much (yet)

I have heard/read that the 850-S is a real nice radio but that it has been
discontinued and that both Kenwood and ICOM and heading for new models this
Fall that bring lower cost DSP radios into the market. So it could pay to
wait.

Good luck at the VE session!

I have owned a TS-850sat and loved it! I sold it about a year ago and have
been looking for another HF rig for the past couple of weeks. I looked at the
736 and decided not to get it since I heard too many folks say that the
receiver was not as quiet as the 850. I know a lot of EME'ers use the 850 and
for weak signal work like they do a good receiver is a must. I have been told
that you cannot get the optional filters for the 736 like you can for the 850.
If you NEED to have 6M's got a 6M rig or xverter for the 850. I ordered a
Ten-Tec scout so I could at least get back on the air till I decide what to
get. At this time, I am going with the Ten-Tec paragon for the rig in the
house and keep the scout for camping.

Just my $0.02 worth.

527. AEA Isoloop decent antenna?

Looks like we're selling our house and moving into an apartment forawhile. Ground floor. With a patio. Am trying to figure out what to do for HF antenna. How about this AEA Isoloop? Would it work fairly well sitting on the patio? I don't expect a miracle...just something that would work better than stringing wire up inside the apartment. All comments are appreciated!

>
>Now then, if you want to trash Tandy and their proposed Family Radio
>Service. . .that's another topic entirely.

I bought a HTX-202 with warranty. Two months after purchase it blew up while I was on vacation. The Radio Shack policy is to repair unit in about a week. They bent over backwards, broke their rules, and traded me a brand new unit so I could continue to have a radio during vacation.

Now thats service.

>
>I'm looking for input on what people thinkof the Yaesu FT-8500 dual bander.
>I'm looking to buy a new rig and I'd like to know if I should go any
>further or look elsewhere. Thanks.

I like it's track tunning. As you move thru the band the radio retunes itself on the front end. With it modified 125-165 VHF and 420-500 UHF it's got the tightest receiver around. Iv'e had Kenwood 731's, 75's, Yaesu's 5100, FT24, 2400, and 530's. The 8500 is the best out of all of them for receiver rejection of unwanted signals and sensativity to those wanted.

I mounted the mike(also called the "pickel") on a 10" goosneck off the hump so it's up where my hand is on the armrest. Very nice to be able to adjust sound, scan on one side and flip thru channels on the other side while driving along. With it in this position Im familar enough to able to do it w/o looking at the mike. Thus avoiding rear-ending someone.

A trick I did to brighten up the display contrast was to remove the red covers off the 4 tiny light bulbs inside the front display. Now the display is lt. orange instead of deep orange/red. Made all the difference in the world for daytime viewing. I also got the remote install kit and mounted the display up against the headliner above the mirror.

Yaesu will be offering a different mike option in the near future. Its just like the 5100 mike and has about 5 extra buttons to do all the programing with, all on the same side. You can
buy the radio with either mike or if you already have it you can buy the new mike when it comes
out. Don't know the price yet.

Yaesu will also be offering the ADMS-2 remote programming software/cable kit in a couple of weeks. This softwear/cable combo is manufactured by the same company who did the kit for the 51 h.t. I beta tested the softwear and it's good. Works under Windows 3.1 or higher.
I purposly have been waiting for it to fully program up my 8500. With what would take about 1.5
hours of programming by hand will now take 10 minuits. And next time my radio need to be reset
all I have to do is hook up the computer to it again and download the programing. Great stuff.

Hope this helps

73's
Brad

538. WTB - Used HF Transceiver

Newsgroup: rec.radio.amateur.equipment

From: keith@unm.edu
Message-ID: <40lk35$p0@carina.unm.edu>
Source record: 213827

Just picked up a 2340h and need (if possible) to do MARS-type
Tx/Rx mods. I say "MARS-type" because I actually only need as far
as 152 Mhz to cover the search & rescue freq.

Separate question: What (if anything) do you folks who use extended Tx
do about antenna tuning, especially on HTs? Do you actually have a
tuner for the HT? Separate antenna? Not even bother?

PS Looked in Oakland's "mods" directory; no IC2340 listed.
THX for any help, email to keith@unm.edu or post.

545. Need Help Understanding FT900 Operation

Newsgroup: rec.radio.amateur.equipment
Date: 1995-08-13 00:00:00 UTC
From: tedm@btree.brooktree.com
Message-ID: <40lrro$dfh@btree.brooktree.com>
Source record: 213833

Need help in understanding why a cw signal received on my FT900AT transceiver does not appear to be centered in my adjustable IF passband (or maybe it's the other way around).

When I zero-beat the audio note with the sidetone (which I assume corresponds to centering the signal in the IF passband), the signal seems much closer to one side of the IF passband than the other, as indicated by the rotation of the passband adjust knob in both directions from center, and the S-meter. Also the S-meter reading tracks roughly with the loudness of the note coming from the headphones.

Any suggestions? Also would like to hear from any FT900 users just to exchange operating information, including the anything on the "shuts itself off" bug. Thanks.

From: corey@mcs.com
Message-ID: <40lu7p$c6m@News1.mcs.net>
Source record: 213834

Does anyone have the specifications on the Motorola Radius p110 UHF radio?

I called Motorola's general number and asked for a portable product catalog, but they said they did not have one
and referred me to the nearest dealer!

I have a 2 channel radio and was wondering if :

1) It is programmable or XTAL
2) wattage,etc
3) can you modify it for more channels?

4) In a related subject, I understand the HT-600/Radius 200 radios
can be easily modified for 6 channel operation. How do you remove the knobs
or escutcheon to gain access to the pin you need so the channel switch can rotate to the other positions?

Thanks,

Jeff WB9KAZ

548. Radio Identification (was Stolen Radio)

Newsgroup: rec.radio.amateur.equipment
Date: 1995-08-13 00:00:00 UTC
From: "Sarah K. Doran" <scba@teleport.com>
Message-ID: <67448.scba@teleport.com>
Source record: 213836

I work for a police department and can attest to the fact that the single best way to mark any piece of equipment is with your driver's license number. Example: OR9999999DL. No spaces in between, so nobody can insert anything. Any police agency in the United States and Canada has access to drivers license information 24 hours a day via computer. As this is also public information, any citizen can also access it, although it's a bit harder. It's easier to drive down to your local police station and hand over the found property to them and let them worry about it!

Even if you move to another state, we will still be able to find you. Your driver's license number is a permanent record of who you are and what kind of driver you were, so it will be there even if you aren't. If it doesn't have your current address on it, we can even do a search through every state until we find you!

When we enter stolen property into the state and national computer systems, we enter it by type, make (brand), model, Serial #, and any owner applied number. If your radio is engraved with a drivers license number and you have the serial number, the chances of you seeing your gear again are a lot higher. If some bad guy has taken the liberty of scratching off either or both numbers, and he can't prove to us that the radio is really his, we will most likely take it into safekeeping until we can figure out who it really belongs to. Serial numbers are usually on the radio in multiple places and even the ones that have been scratched off can sometimes be reconstructed. Some states also have the ability to search their stolen property files by partial serial number.

The moral of this dissertation is this: Make sure you have all of your gear identified with some sort of identifying number and make sure you keep that information in a safe place. That way, if your gear does get lost or stolen, you can provide us with all of the information we need to enter it into the system so you can get it back!

I am pleased to announce a new product offered by Positive Time Systems called the RCS-I. This is a radio controller that connects to any VHF/UHF transceiver and can issue x-10 commands. (X-10 is a power line standard for controlling devices throughout a building. Sears, Radio Shack, and others offer these compatible units)
The unit also has an alarm input, a listen feature, a short voicmail box, and responds to all commands in a pleasant female voice. The system IDs with your recorded voice and call sign. This description doesn't do the product justice, so please check out the new homepage at :

http://www.halcyon.com/pos.time.sys/top

or you may email us with you address so that we can promptly send you our brochure and newsletter.

NOTE: This product is intended for US voltages of 120 / 220 VAC. Another version is offered to support other international power standards.

FLASH! NEW FEATURE! The RCS-I has a new feature called Secure Access Mode(SAM). When enabled, the access code changes dozens of times per hour, making it virtually impossible to hack into.

Thank You,

Marshall Craw <mcraw@halcyon.com>
Positive Time Systems
North Bend, WA

550. IC-2340 mods?

Source record: 213840

Gary, agree on your evaluation of the Standard 508A dual band HT. I believe that you CAN program a memory so you transmit on one frequency (450 band) and receive on a different one (2 meter band). This would allow you to use the mobile rig as an extender and receive on the 2 meter band.

I bought mine mainly as a portable scanner for use at athletic events, etc. where small size, but not long range are important.

73,

John, KF9GW

Be very careful. The tube seals may not take silver soldering very well. The earlier statement was correct that if the solder is melting and running out of the pins the tube is probably running too hot. Remember the 922 was designed to be a 1 kW dc input amp, not 1 kW or more OUT. The cause could be: a poor factory joint in the pin... A poor connection or weak clip in the socket..... or too much power for the airflow.

Resolder it with normal solder. If it melts again correct the problem.

Hello, I just stumbled upon 2 power supply bearing the name Lambda,
they have variable output from 12 to 14 vdc, at a very thight scale,
(ie: you can easily get 13.69 if that's what you want),
the units can give up to 20 amps. They are small in size, the same
size as a normal kleenex tissue box, so if anyone can tell me if they
are reliable, I'd appreciate it!

Source record: 213849

Hi guys,

I'm having a problem and I want to know if any of you can help me.
I've re-installed a vertical (ring-o) antenna for VHF (2 mt) with a 6dB gain.
The 1st time I did it, I use 70 mts of regular RG-58 (I know it's awful...) and
I could trigger (and hear the response) our farest repeater.
Now I'm using 50 mts of RGC-58 (cellular insulation) and I'm having troubles with the RX.
I can reach (with signal 9+ from a Icom IC2GAT) places I didn't before, but I can hardly hear
some repeaters. Tests shown I can trigger all repeaters, but I can't hear the responses, even
with no squelch at all (all open).

Facing me (my shack) there's plenty of TV tx antennas and FM broadcast antennas, and I'm getting
full of blank (?) noise.

So, I can reach almost all the town and neighborhood, but I can't hear...

Someone asked about a low-pass (or hi-pass) filter... Will they work ?

Please, help!

Thanks

Carlos Eduardo Strauch - PY6ST

Lambda power supplies are commercial (or test bench) grade
switching power supplies and are supposedly quite reliable.
If you can get it at a reasonable price, snatch it up!

Source record: 213852

I lived in a Townhouse for five years, I had two full stiries plus
a third floor attic. A lot of storage. I had a AEA Isoloop the older
model. It worked very well. I also had a 40 meter shorten dipole and
a full size 20 meter dipole up there. I work a good deal of DX with
that AEA, but the cycle was high at the time. The bad thing about the
IsoLoop is that it is very hard to get resonance. Very touchy. So
once you get the hang of it you'll find that it works quite well for
it's size. Remember though 150 watts is all it can take.

>The yaesu EDC-1 (?) is a great DC adaptor. It clips onto the
bottom the radio, powers it at 11.5V and trickle charges the
battery at 50ma! the clip is quite small, the regulator is in
the cigarette lighter plug!
<

I am glad you mentioned this. I have a question aobut the trickle charge.
I read in the manual of my 51r that it is not a good idea to keep charging
a halfway used battery, or one that has had very little use. Is this really
a problem? I thought these new NiCds had gotten around the memoryu problem,
and this would not be a problem? Also, how does the Trickle charger fit into
this?? If everyday I get home, I hook up the EDC 12, and the battery is only
about 1/4 down, is it going to mess it up? Also, how long does it take to
charge a battery with the trickle charge?

I also have a question about another type of charger that I bought used. It is
a little different than the EDC 12. It replace the battery completely. It's
plug for the cigaret outlet has a green led on it, but appears to be a standard
plug. Other wise, the part that replace the battery is about the size of the
9.6v battery. It is very light, as if empty. What exaclty is this? Why does
it only give 8v of output power?

Thanks!!

Radio Shack saw to it, via design, that the HTX-202 could not be modified for transmit or receive outside of amateur bands. While I'm not into packet radio, I have heard of a mod for 9600baud operation. If this is the sort of thing you're looking for, check out the following ftp site:
ftp oak.oakland.edu/pub3/hamradio/mods/<name of manufacturer>

There's a wealth of info there on all sorts of radios and mods. None that are gauranteed, of course.

...snip...
It is generally a good idea to allow nicads to run down "completely" before
charging. There are exact voltages specified by some makers, but you needn't
worry too much. When the radio quits, immeadiatly recharge the battery. With
such an approach you'll see a good useful life out of your nicads. The concerns
about "memory" in nicads have been much reduced with improved technology over
the years - but by no means eliminated.

Sounds like a W&W Associates WCE-091B3-FNB35(S) Battery Eliminator - $39 new.
There is a circuit inside to regulate the voltage at a safe level - 8vdc - as
your FT-51R is designed to run at 9.6vdc. W&W is one of a number of companies
making radio batteries, chargers and other accessories. I use their batteries
in place of Yaesu batteries in my FT-51R.

Source record: 213858

There are many ways of scanning international phonecalls (in case there are people who believe that interantianl phonecalls are not traceable).HHYou need:H- A dish tuned to a comms satellite (C-Band feed).H- A SW radio with SSBH- A satellite receiver that offers baseband, unclamped video outputHH
You tune to a comms satellite (try Intelsat at 24 degrees West, around 3800MHz).HYou tune to a comms channel. This is a channel that on a video monitor identifies as having short, white bars, scrolling horizontally across the screen at various positions.HYou connect your SW radio to the baseband output and tune around 4MHz, USB. Every 4 khz you will get a new call. HHThis procedure is used for FDM (Frequency division multiplexing). TDM is different and undecipherable.HHBest,HHPeter, KC1QFA

>Carlos Eduardo Strauch - PY6ST
Firstly, you are still in a poor situation with 50m (164') of RG58, no matter the insulation. With the best of insulations, you'll have a cable loss of 7.8db, or -1.8db system gain.
Worse case is a cable loss of 11.2db, for a system gain of -5.2db. If you go to Belden 9913 the cable loss is down to 2.6db, for a system gain of +3.4db. Using RG-8(foam dielectric) brings you a cable loss of 4.3db, system gain of +1.7db.

Whether or not you need any of this gain is something that can only be guessed at from this far away. I'm able to work mountain top repeaters with a fraction of a watt into a rubber-duck antenna from 10 to 20 miles. All situations vary greatly.

As a troubleshooting approach, consider the last thing you did. Before you did it, you could hear the repeaters, yes? Now you can't? Did you install the cable connectors yourself? Could there be a defect there? I've seen complaints of "I can hit it but I can't hear it" be traced back to cable troubles a number of times. Ispect the cable most carefully for crushed or pinched areas. Installing a long cable run can leave un-noticed damage. If all is well with the cable, take a good look at the antenna for any defects. If ni troubles are found, try measuring forward and reflected power. Measure it both at the transmitter and at the antenna if possible.

I live in very close proximity to many high powered transmitters. I've not seen any troubles caused by them other than the usual intermod. So I would doubt that a filter would help you much. Lastly, get better cable if you

possibly can.

Sorry for getting slightly off topic, but I've always wondered about
engraving your license number on a piece of gear (any gear) in our
mobile society.

If I move from N.C. to another state, I *must* get another driver's
license. Won't my license number change also? Then I must either
engrave the new number into the radio, or the police running the
number will get a null. Or, how about when I *buy* a used piece of
gear? Sure, I've got a bill of sale, but now I also need to engrave
my license number in the radio. And if I move??? The radio could
end up with 2 or 3 driver license numbers in it. SO... then the
thief could just engrave his license number (or one on a fake
driver's license he obtained for this purpose) to make it look
more legit for him.

Heck, the police around here have told us that when most theives
find out it's ham gear (instead of easy to sell CB gear), they'll
just dump it in the river anyway.

I've had my car broken into. I lost an ICOM IC-22A (this was
20 years ago) and 25 eight track tapes (this was TWENTY YEARS AGO :-).
They left my Cross pen (perhaps they prefer MONT BLANCs) but
took my 19" whip antenna made from a coat hanger affixed to a

PL-259. They did re-lock my car when they left.
I didn't have anything marked, and never got anything back.
Based on what the police told me, I'm not sure marking would have
helped.

Lambda has been a major brand name in OEM power supplies for a great many
years. Very reputable. Very durable designs. Good stuff when new. But you
can never predict how used gear has been used/abused, or the life remaining.
Starting out with a good make can only be a positive indicator.

575. WANTED: SERVICE MANUAL (ORIGINAL) FOR R L DRAKE UV-3

Newsgroup: rec.radio.amateur.equipment
Date: 1995-08-14 00:00:00 UTC
From: mc@shore.net
Message-ID: <40noog$78@northshore.shore.net>
Source record: 213863
Cross-posted to: rec.radio.swap,rec.radio.amateur.equipment

I just picked up a clean DRAKE UV-3 VHF/UHF transciever with all three modules and no documentation. Does anyone have an original of either the operator's manual or service manual they no longer need and would like to part with? The unit works nicely (now) and I think it's a "keeper" so I'd like to have the appropriate manual(s) in case of future need.

Reply by e-mail.

Cordially,

Michael Crestohl, KH6KD/W1

Jay A. Dunn (jdunn00@mail.gpbx.net) wrote:

: 1) Radio - Drake TR-4C - $300

With equipment of this age, price is dependant entirely on
condition.

The TR4 is valve (I'm British if you haven't just guessed..) based.
High voltages are involved, and it is dangerous to work on it if you are
inexperienced. It gets hot. For these reasons, you ought to question
the probable reliability of equipment of this era.

If it's in decent condition, and you're prepared to do some
maintenance you can learn a lot from one of these radios. The TR4 was
one of the best performing radios of its time. A previous respondant has
suggested that things have moved on a lot in the last 20 years. He's
quite right, but progress has been uneven. Modern radios have improved
very little in terms of phase noise and front-end intermodulation from
the levels set by some of the classics. Modern radios have grown all
manner of "features" that DO make operating more convenient, and give
the operator a few more things to play with.

If you get very brutally pragmatic, and ask what you would be able
to work with a modern, all singing, all dancing rig that you couldn't
with a good TR4, then the answer is "very little"

If the TR4 represents your rough budget, then if you do choose to
look for a later all-semiconductor radio, you'll be limited to very
early models (and probably ones in rough condition) I'd suggest that
the first all-semiconductor radios were not up to the standards of the
better valve based radios in a number of important respects. It has
taken rather a lot of time to engineer out the failings of these early
transistorised radios, and only a few of the best don't have a couple of
areas where the Drake can give them a good run for their money.

The era of hybrid designs; semiconductors for all low level stages
but valves for transmitter driver and output has given us a few
classics:

TS530, TS830
FT101ZD, FT901

Of the bunch I prefer the TS830. Note that the FT101Z and FT101ZD
are almost completely different radios to those bearing other suffixes.
The FT102 is a posher derivative of the '101ZD with a few more features
and a rather good output stage running 3 valves in place of the usual 2

Any of these five should prove satisfactory, at a higher price, though. On receive, they are not quite as clean-sounding as the Drake 4 series, and are more prone to intermod effects. The low power sections are safer to work on, but the PA and power supply areas are just as deadly as the all-valve radio.

The Drake uses TV output valves, abuses might be a better word. If you know what you're doing, you're OK but they are less tolerant of long tuning periods.

Any radio in the bottom price bracket will likely need parts and maintenance. Don't reject age and "toobs" automatically, in some respects the latest and greatest have made hardly any progress.

Things depend a lot on condition, and on availability of experienced guidance.

: 2) Tuner - Drake MN2700 - $175

Manual antenna tuners haven't changed at all, and usually have a wider operating range than automatic units. Good clean units fetch high prices.

Have fun

David GM4ZNX

579. FS: HTX-404 Radios

Newsgroup: rec.radio.amateur.equipment
Date: 1995-08-14 00:00:00 UTC

**** !!!PRICE REDUCED!! ***
I posted this before and agreed to sell the lot to one person, but it
fell thru. Here's another shot:

FOR SALE: Radio Shack HTX-404 440 to 450mhz Amateur Handie Talkies.
*** I have 3 of these at $175 each + shipping. ***
*** Will Consider Offers On 2 or 3 Radios. ***
*** May Even Consider Offers On 1 Radios. ***
*** Will program the 12 memories to your specs ***

These radios are based on the Icom IC-04AT, but with certain changes for
Radio Shack. Has DTMF memories, PL Decode as well as Encode, Power Saver,
PTT TOT, Scan, Priority Scan and DTMF Paging. Icom accessories for their
models IC-2/3/4AT, IC-02/03/04AT, IC-32AT and a variety of commercial
handie talkies will work on this radio.

Each radio is in it's box with: manual, wrist strap, nicad battery, AA battery
holder, slow charger, antenna, belt clip. 1 of the radios was packaged in
a HTX-202 box and has a photo-copied manual. I bought these 3 expecting to pass
them along to members of our SAR team, but all 80 or so amateurs are chonically
afflicted with "Twin Band Fever". All radios are in good working
order and of good appearance. Terms will be payment in advance by check or
money order, as you wish. You pay shipping.

581. Need help with radio signiture/fingerprint tech.

Newsgroup: rec.radio.amateur.equipment
Date: 1995-08-14 00:00:00 UTC
From: jmp@ipctech.com
Message-ID: <jmp-1408950938280001@shipping.ipctech.com>
Source record: 213869

I have heard that this technology is being used at the amateur radio level to identify radio transmissions from radios that are either being used illegally or are in violation of accepted radio practice, etc. As regards several of our local repeaters, we have had numerous problems in the past and many amateurs have spent countless hours trying to get a location and track down the offending stations. This is'nt quite doing the job since a lot of this activity seems to come from mobile stations. I would like to hear from anyone who has USED this method of fingerprinting various radios during illegal transmissions and comparing the signatures to the same radios when the operators may be in the "accepted mode of operation", thus using their real call signs, etc.
Again, the news that I have heard is second hand, so please keep any responses to this request to those who actually have successful "hands on" experience. I do appolgize if I missed any recent info on this newsgroup. I seem to recall a recent thread on this but did not get much out of it.
Thanks in advance.
John

Since US amateurs are limited to 300 baud on HF (except for 1200 baud
on 10 meters), you aren't going to be able to do realtime digital voice.
The best compressed codec performance still needs at least 2400 baud,
and fidelity is much better at 9600 baud or higher. You could get an
STA from the FCC for a higher rate, though.

>
>1) Radio - Drake TR-4C - $300

Good radio, not as good as the T4X-R4C pair though. That price
would be right for a primo unit with manuals, power supply,
and speaker cabinet. An external VFO would add another $100.

>2) Tuner - Drake MN2700 - $175

Good tuner. That price is a hair high, but not way out of line.

>3) Amp - Heath Kit SB 200 (2kW) - $350

Ok amp, Ok price, if the tubes are good.

>4) 2m Mobile - Kenwood TR 7400A - $250

Overpriced! $125 might be fair. Not a great radio.

Lambda is a well known (and well hated) maker of commercial switching
power supplies. When they work, they work very very well. When they
fail, they're a royal bitch to repair. They are typically *very* RF
sensitive too, so be careful using them around transmitters.

589. Icom 751a: opinions wanted

Newsgroup: rec.radio.amateur.equipment
Date: 1995-08-14 00:00:00 UTC
From: pklein@news.seattleu.edu
Message-ID: <40o0d3$e9u@bach.seattleu.edu>
Source record: 213877

Does anyone have experience with the 751a and how it compares to other ICOM radios and/or the TS-850?

Background: I've decided to replace my aging Icom 745. Reasons: it won't do AMTOR, has problems with overload, spurs and distortion under crowded conditions, and tend to heat up and drift when transmitting. If I buy new, I'll probably go for a Kenwood TS-850SAT. It appears to be a better radio than the similarly-priced Icom 738.

But I'm also interested in a quality used radio which would be a truly *significant* improvement over the IC-745, but cost less than the TS-850. Also, I have an Icom desk microphone, power supply, FL-44 deluxe SSB filter and 500 Hz CW filter that could be transferred to a newer Icom radio. Icom's service center is right here in the Seattle area. So I have some reasons for staying with Icom.

Based on the above, I've thought about getting a used Icom 751a. However, after reading the ARRL Radio Buyer's Sourcebook (reprinted QST reviews) and talking to a few people (including ICOM service), I'm confused. I've been told that "the 751a was the best radio Icom ever made." I've also been told that the just-discontinued IC-735 receiver will outperform the 751a, that the 751a runs hot, and that the 751a has a similar front end to the 745 and may have similar overload problems.

The QST reviews are not much help, as their review is of a 751, not a 751a. Also, I'm not sure how much I trust them. QST's 3rd order IMD figures for the 745 on 20m are better than either the 751 or the 735(!)

For reference, I'm not a competitive DXer or contester. I do like to DX (mostly on CW), but not obsessively. To me contests are just a convenient way to work a new country or two. I like to ragchew on both SSB and digital modes (mostly Pactor these days, and want a radio that will do Amtor). So I don't really need "instant QSY" memories and contest-winning features, though the ability to work "split" is important.

OTOH, I like having good, steep-skirted filtering and variable bandwidth, aka "passband tuning" in both CW and SSB. And the ability of the receiver to resist overload is important--I live in a city with a lot of big guns. Adjustable CW sidetone pitch that tracks with transmitted signal would be nice, though I've lived without it until now.

Does the 751A have the software in battery-backed RAM like the 745, or in ROM like the later models?

All advice, anecdotes, passionate opinions and wild rumors welcome :-)

> hillgen@eden.rutgers.edu
>

While I'm not an owner of one of these radios, I can tell you what I
think as a listener.

The transmitted audio on these radios (at least the three I've heard)
has absolutely SUCKED. It is very bass sounding and muffled, bordering
on distorted. I'm not impressed by this and wonder why a radio that
costs as much as this sounds so cheap.

I have two friends who have this radio. One is on his second 8500. He
sent his first 8500 back because of poor transmitted audio. His second
one is only slightly better than the first. His second radio was provided
to him for no charge. He also doesn't like to grab the mic and invariably
change a setting. Sure, he could lock up the mic but that is one more
thing to have to do before changing a channel or something. Kind of goes
in the face of convenience, which is what the "do-all" microphone is all
about.

My other friend obviously hasn't listened to his own signal. He sounds
even more bass and muffled than my first example. He really likes
"Mr. Potatohead", the microphone. ;-) He likes this radio so much that
he is going to buy another for use at home. I have difficulty understanding
what he says over his radio when I have any sort of background noise. It
really is that muffled/distorted.

In short, I think Yaesu has made a mistake somewhere with the FT-8500. I
like the way the FT-530 sounds; I have one.

Oh well. When I make the daul band mobile plunge, it isn't going to be
for a FT-8500.

Hi all.
I am looking for a Spectrum Analyser option for a Cushman CE50A. If
you have one that you don't want or know of a junker somewhere, I would
appreciate a reply.

Thanks -Rob-

If you have the manual, schematics, and foil pattern drawings that came
with the radio, you have pretty much all you need to troubleshoot a poor
receive sensitivity problem. The very FIRST thing to check is the connection
to the BNC antenna connector. A very common problem with this radio is that
the tiny component, (I haven't checked in a while) a capacitor or inductor
that connects the center pin to the PC board breaks loose from the pin.
This is the most likely situation if the problem exists on both bands.
The next thing to look at is the first RF amplifier transistor which can
be found on the schematic and then the foil pattern.

The equipment you will need is:

a good VOM
a signal generator for 146 and 440 MHZ with a calibrated output level
so that you know what the _absolute_ sensitivity is, rather than a
relative level
the necessary hand tools needed to open and disassemble and reassemble
the radio.

Good Luck and good hunting

Lambda supplies are very reliable. Most of them are built for brute
strength and can take a lot of punishment. Do yourself a favor and mount
it in a metal cabinet. They don't get along well with RF!

599. Re: FT-840 vs IC-735

Newsgroup: rec.radio.amateur.equipment
Date: 1995-08-14 00:00:00 UTC
From: mtrail@violet.berkeley.edu
Message-ID: <40nugi$ip@agate.berkeley.edu>
Source record: 213887

Hi!
Since almost all the responses to this question have been
in favor of the 735, I thought I'd put a few words in for the 840,
which I have. It's a fine rig, with very good sensitivity, ease of
operation, if shift, etc etc. The reason you might think of it over
the 735 is one of new-rig reliability over the uncertainties of getting
a used rig. Unless you know and trust the source of the rig, you can
never be sure about the rig's history, and you don't have the luxury
of a warranty. Both rigs are fine, but given that the prices are
about the same, why not get a NEW rig for your money? I really don't
think you could go wrong with the Yaesu. Great service there too...
Good luck, and 73

Extended warranties are a rip off. Read the facts in Consumer Reports.
However, RS seems to be the exception. See, extended warranties are a
rip off when you buy them for quality manufactured goods. Typically,
the quality products do not fail and the retailers make out like
bandits.

With the RS products, the way they always seem to be "blowing up"
after you buy them, well you probably need the extended warranty.

Rick,
The ANC-4 works fine at 50 MHz. It has a maximum usable frequency of
about 80 MHz, so it covers the 6m band with no problems.

There's an ANC-4 FAQ on the JPS Web Page under the Amateur Radio
Products heading. The URL is:
http://emporium.turnpike.net/J/JPS/jps.html
Or you can request a copy via email to jps@nando.net

Message-ID: <40p9r2$100@usenet.INS.CWRU.Edu>
Source record: 213706

I am having a tought time figuring this out. I have got two 51Rs that
my wife an I use. It is important that both of us be able to set the radio
on monitor, but not have all the traffic opening the squelch. I have got the
CTCSS paging system to work fine on a SImplex channel, but can not get it
to work with a repeater. However, when I talk to another person "out there"
every thing seems to be working fine. Such that the test person receives my tone
just fine and it opens his squelch, and I receive his tone just fine which
opens my squelch, while other people xmissions are not passed thru.

Do I have somethign set wrong? Or what?? I am not sure which radio the other
guy is using, but I have switched the role between my two radios. THey just don't
seem to receive the tone from the other one, even though I am able to receive the
tone of somebody else on the freq??

Thanks for any suggestions!!

615. JPS ANC-4 review (repost)

Newsgroup: rec.radio.amateur.equipment
Date: 1995-08-15 00:00:00 UTC
From: gkd@wpi.WPI.EDU
Message-ID: <40p9t0$5j6@bigboote.WPI.EDU>
Source record: 213708
Cross-posted to: rec.radio.shortwave,rec.radio.amateur.equipment

Below is a review of JPS ANC-4 Antenna Noise Canceller, written from a SWL/Ute. monitoring perspective, which I posted back in March. I'm re-posting it since there have been so many inquiries lately about this product. JPS also has a web page at:

http://emporium.turnpike.net/J/JPS/jps.html

which contains a lot of good information about the ANC-4. My only affiliation with JPS is as a satisfied customer.

Greg

==========

JPS ANC-4 ANTENNA NOISE CANCELLER (3/95)

Because of the success which I'd had with the JPS NIR-10 DSP, the product announcement for the ANC-4 Antenna Noise Canceller from JPS caught my attention right away. I purchased one shortly after placing a telephone call to Tom Jacks of JPS for additional details.

As Tom explained, the ANC-4 is not a DSP device. It is an RF device which connects between the receiver's antenna input and receiving antenna (using PL-259 connectors). A "noise" antenna is also connected the the ANC-4; consisting of either a small telescopic antenna or a short length of wire (both of which are supplied). The intent is for the noise antenna to be as responsive to locally generated noise as possible and as unresponsive to actual signals as possible; which is just the opposite of what the main antenna should do.

Inside the ANC-4, signals from the noise antenna pass through a phase shift network and noise amplifier, after which they are combined with signals from the main antenna in a hybrid combiner. Noise gain and noise phase controls on the ANC-4 are adjusted by the user so that the locally generated noise being picked up by the noise antenna is of equal amplitude to the local noise which is being picked up by the main antenna, but is 180 degrees out of phase from it. Thus, the noise is effectively cancelled out.

There is nothing magical about this process. Phase cancellation is definitely not a new concept, but JPS seems to have done a good job implementing it here. The first thing I noticed about the ANC-4 is that it is built like a battleship; weighing in at over 2 pounds despite its small size. (I figured out that my 16-pound ICOM R71 would gain an additional 10 pounds if it were of an equivalent density.) Most of the ANC-4's mass is in its heavy duty cabinet, which I'd guess is intended

to stabilize operation and minimize interaction with its surroundings.

As for performance, I've tried using the ANC-4 on a variety noise problems. In general, improvements have been most apparent on the strongest noise problems. Signals which had been completely covered became copyable. Nulling out lesser static sources where weak signals were still audible in the noise produced mixed results. About 3-6 db of receive signal is lost in the hybrid combiner, and the ANC-4 often introduces some low level noise of its own. These factors are negligible when tackling significant sources of interference; but with low level static problems, the attenuation and added noise from the ANC-4 may make weak signals more difficult to hear despite the fact that they are static-free. A preamplifier placed in the antenna line prior to the ANC-4 might be able to compensate for the loss in the hybrid combiner; as long as it didn't introduce artifacts of its own. I often find the NIR-10 DSP to be more effective on very weak signal static problems than the ANC-4.

Note that any noise introduced by the ANC-4 is not internally generated in most cases, but results from the fact that the noise antenna behaves as an active antenna and picks up whatever RF is present in the shack (signals, noise, etc.). The more noise gain which is required to null out the noise being picked up by the main antenna, the greater the magnitude of other (non-cancelled) RF from the noise antenna which gets introduced into the receive path. Intermod will be introduced as well if the noise gain is increased too far. (Again, when tackling strong noise problems, these effects are negligible in comparison to the benefits realized.)

In one instance, I had some low level electrical static in the 11 MHz range. It was not very noticeable when listening to SSB communications, and the effects of ANC-4 made the weakest signals more difficult to hear. But with the wider bandwidth of the AM mode, the static was quite apparent even on a reasonably solid S-6 broadcast signal. Activating the ANC-4 completely eliminated the static on the broadcast signal, making it much more pleasant to listen to.

The ability of the ANC-4 to null local noise does vary depending on the source. Sometimes a complete null is easily obtained, while other times it can be very elusive. Experimenting with the location and polarization of the noise antenna may be necessary in the more difficult cases. If the shack is exceptionally well isolated, the noise which is present at the receiving antenna may not be present in the shack for the noise antenna to hear. In this instance, locating the noise antenna outside the shack closer to the noise source may be helpful.

Conversely, if an indoor or inefficient receive antenna is being used, it's signal-to-noise pickup ratio may not be any better than that of the noise antenna. This could possibly compromise the ANC-4's effectiveness, but it's been giving me good results with just some random wires strung out the window for receive antennas. I also think the unit is best suited for use with a good quality tabletop receiver, rather than a less expensive portable. It includes automatic transmit-receive switching for use with ham transceivers as well.

Multiple, simultaneous noise sources could present another special challenge for the ANC-4, although Tom Jacks mentioned that a good degree of cancellation was usually still possible in these conditions. Locating the proper "null" setting on a noise source which is varying rapidly in intensity takes some persistence. I was experiencing interference from a TV horizontal oscillator in the 3-4 MHz range one night. The level was continually changing with the video image, but I finally found a halfway decent null setting. Some noise (probably from power lines) I only experience in wet weather. On one damp day, the noise first appeared in a very unsteady manner when it started drizzling. I wasn't able to null it out until the rain picked up and the noise became more constant. Perhaps during the initial period its phase and amplitude were both changing.

Sometimes my receiver's noise blanker can be just as effective as the ANC-4 in combatting certain types of electrical static, but there are many other times when the ANC-4 gets rid of stuff that the noise blanker doesn't even touch. I usually try the noise blanker first, since its operation is much easier. I also find that it is best to temporarily turn off the noise blanker while attempting to adjust the ANC-4, since the noise blanker's action may obscure the ANC-4's nulling effects.

Although the ANC-4 supposedly operates from 100 KHz to 80 MHz, I've had limited success using it in the AM broadcast band and below. It sometimes helps, but often I haven't been able to null static which the noise blanker handles easily.

When evaluating the ANC-4, it is important to listen for actual improvement in the quality of receive signals, not just noise cancellation. I occasionally found myself thinking I'd achieved some wonderful state of static cancellation, until I realized that most of the signals were no longer audible either. The manual warns that this may happen if the noise is not stronger in the noise antenna than it is in the main antenna. Turning the ANC-4 power switch off does bypass the unit as well, so quick "in/out" comparisons are easy to make.

The ANC-4 instruction manual is very straightforward and easy to follow; but with my inquisitive mind, I'd have preferred to see operational theory covered in greater detail along with a schematic diagram to complement the block and parts layout diagrams.

Overall, I'd say ANC-4 seems like a valuable tool for those experiencing severe local interference from power lines or appliances (including computers) which cannot easily be cured by other means. A DSP might still be a better choice for low level noise problems, but it's tough to say with certainty which device will work better in each specific circumstance. The ANC-4 does require a lot more critical "tweaking" than a DSP, and must be retuned every time a substantial change in frequency is made. This can make it a bit tedious to operate for someone who likes to jump around a lot all over the bands; but if the interference is severe, the effort is worth it.

I purchased an O. A. R. ADFS-320-405 Direction Finding Unit that
needs some work. I need an owners and shop manual to align the unit
and would be happy to pay for copies etc of your manual if you don't
want to part with it. Anything even close might help out. I also need
the scope tube for the unit. It's a B-Scan S159P1 tube. The one
that is in it now has a shorted screen grid but might be rebuildable.
If anyone has any experience with this kind of unit I would
welcome the E-mail and any suggestions about how to get these items
for the unit would be great as O.A.R. is no longer supporting this
model and doesn't even have a copy of the service manual.

```
For Sale: Neutec VHF Mobile Repeater, Model SM-1645HS
- 45 watt, 16 channels (eeprom - no crystals)
- Scan and Priority Features
- Service manual, in very good condition

Manufactured by Ranger Communications this radio
is a current production model.

Asking $395 (plus shipping),

Res-Lok Duplexer, Model Q2220E
Tunable from 138 - 175 mhz.
Currently tuned for 148.325/150.100

Manufactured by Sinclair Radio Laboratories

Asking $240 (plus shipping)

Regards,

Rich Creal

From article <40orqiknh1@mhadf.production.compuserve.com>, by David Solomon
<70353.403@CompuServe.COM>:
> Is there a usenet newsgroup for buying and selling ham equipment?

Yes, there sure is, David! Rec.radio.swap was specifically set up as the
correct place for buying, selling, and trading of radio and related equipment.
Rec.radio.amateur.equipment is specifically NOT the correct place for buying
selling, and trading of radio and related equipment. It is for the discussion
of production amateur radio equipment.

Maybe Jay should post the "Guide to the Personal Radio Newsgroups" once a week,
instead of once a month? 8^{)

This message describes the rec.radio.amateur.*, rec.radio.cb,
rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet
mailing list counterparts and complements. It is intended to serve as a
guide for the new reader on what to find where. Questions and comments may
be directed to the author, Jay Maynard, K5ZC, by Internet electronic mail at
jmaynard@admin5.hsc.uth.tmc.edu. This message was last changed on 31 October
1994 to add the discussion of non-Usenet mailing lists and streamline most
of the history discussion, and to change the moderator information for
rec.radio.info.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list
for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions
were held on the mailing list, and sent to the mailboxes of those who had
signed up for it. When the Usenet software was created, and net news as we
now know it was developed, a newsgroup was created for hams: net.ham-radio.
The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became
progressively higher. First one by one, and then as part of two
reorganizations, what was once one group became many. In the process,
developments elsewhere on the net were reflected in the groups as they were
created, most notably the change to place all of the ham radio groups in one
hierarchy.

The collection of newsgroups continues to grow as more people join the net,
and as more topics of discussion gain volume, I expect to see more groups be
created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the
notable exception being rec.radio.swap. There are also a few mailing lists
that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them,
and not to the groups that aren't. The whole idea of having different
```

newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec-radio-info@stat.com. Inquires and other administrivia should be directed to rec-radio-info-request@stat.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups rec.radio.amateur.antenna, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas.

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send email with the word "subscribe" on a line by itself to cq-contest-request@tgv.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to

dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

All of the following mailing lists are sponsored to the Boston Amateur Radio Club, as well as some others of local interest. Thanks to N1IST for the information.

qrp-l: This is the qrp mailing list, previously maintained by Bruce Walker at Think.com. It is for discussions about the design, construction, and use of qrp (low power) radios and related equipment.
arrl-ve-list: This is a one-way list, run by Bart Jahnke of the ARRL VEC, for announcements to VEs and VE teams.
w1aw-list: ARRL bulletins, news, and information
newsline-list: Redistribution of Amateur Radio Newsline
letter-list: Redistribution of the ARRL Letter
fox-list: Fox hunting and Radio Direction Finding
fieldorg-l: ARRL field organization discussions
ham-tech: Technical discussions and questions about Amateur Radio
arrl-exam-list: amateur radio license examinations scheduled in the US and in some foreign areas.

To sign up or inquire about these lists, send mail to listserv@netcom.com with the following in the body (subject is ignored) of the message.
<listname> is the name of the list to subscribe to.
To subscribe: subscribe <listname>
To unsubscribe: unsubscribe <listname>
For more information: help
To post (to the two-way lists), send your message to <listname>@netcom.com

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while

still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

I just purchased a used Kenwood TR-751E, 2m all-mode transceiver.
I've been looking through the radio mods archives of several ftp
sites without finding any reference at all to this radio.

Could this be the *perfect radio* ? Yes indeed, it *is* a great
performer! Some say, the best mobile multi-mode Kenwood has ever
made. It lacks bells and whistles, but it has all the basic
memories, scanning functions etcetera you expect from to-days radios
combined with GaAs FET rx performance and great audio.

Just wanted to tell... and wonder if there could be any mods or
undocumented features out there ?

Drew. A lot of repeaters do not pass any of the tones. I think that since it works on simplex and not on the repeater might prove that. Ask around to see if there is a repeater in your area that will pass the tones.

>Drew
>loker@tenet.edu

Most repeaters do not transmit CTCSS on THEIR output signals. Some
do. The repeater Owner has to enable this ability. If it is enabled,
CTCSS will be transmitted anytime the repeater is transmitting. I
think what you are experiencing is a repeater will very good audio and
it is merely passing CTCSS that another user is transmitting to the
repeater, thru to your radio, which is decodeing the CTCSS fine. If
this is the case, you will hear the station fine, with your CTCSS on,
but will not hear the repeater system ID if it is not transmitting
CTCSS. Some repeater systems have the ability to strip CTCSS of
incoming signals, so that they do not pass thru the system. Hope this
helps....73's Floyd Adams (WD5ENJ)

Sure, a lot of them can be modified to go to the commercial bands.
But dont get caught. The fine is pretty stiff.

I agree completely that people should be so permitted. But it is
unlawful to transmit outside of the amateur bands using an amateur
radio. On the other hand, it is entirely within the rules to use a
radio Type Accepted for the commercial/public safety bands to
transmit on amateur frequencies. Generally this means spending lots
more money, and compromising on ease of programming. A few radios that
come to mind: Bendix-King ($$$!), Icom IC-H16, Yaesu (fergot the model).
I understand Motorola is bringing out a keyboard programmable line of
HTs as well.

aja@ag.net (aja@ag.net) wrote:
: I have heard rumors that it can be turned into a cross band repeater
: by holding the rpt key while turning it on.. no luck.. anyone here
: been able to do it?

Given that the FT-411 is a single band radio, no it won't do cross band repeat...

Where the confusion has come from is that the FT-470, the 2m and 70cm dual band version of the same radio, WILL do cross band repeating. (Goes and gets radio to see if can remember how to do this. Pokes a few buttons...Finds answer...)

Yes indeed, you hold down the rpt key when turning on the radio.

More completely, you set up the two bands with the required frequencies, turn the radio off, then hold down the rpt key and turn the radio on.

(You can even set up a conventional repeater with offset on one band and then access it with a radio on the other band.)

The "low" symbol will show that the radio is now on low power for both bands and the "T", "SQ" and "+-" symbols will be flashing.

When ever the squelch is broken one either band, that band is made the secondary (right side of display) band and the transmitter for the other band is turned on. Low power is invoked on both bands to prevent overheating of an unattended radio.

I have seen on Packet a recommendation to use a lead to link the live (tip) from the speaker and the microphone jacks with a resistor, and indeed my radio included such a device when I bought it secondhand. This provides a direct path as otherwise the audio link is simply out of the speaker and back in the mike!

This function is not documented in the manuals and is not actually legal in Australia, however it may be legal in the States, you seem to be able to do a few things we can't, phone patches for example.

Have fun

If anyone has a set that they are willing to part with, or knows of someplace that I can purchase these, please e-mail me.

These flash cards were created to help children learn morse code with assistance of cartoons. They are very helpful for the right-brainers like myself and my husband.

Any help in locating a set of these cards will be greatly appreciated.

Thanks,
Diva

638. Kenwood TS850S VS Yaesu FT-990

Newsgroup: rec.radio.amateur.equipment
Date: 1995-08-15 00:00:00 UTC
From: M740166%SLVMA.PRofs@mdcgwy.mdc.COM
Message-ID: <199508151421.HAA03635@UCSD.EDU>
Source record: 213731

Mark Saunders, tracker@indirect.com, wrote that he would like
to hear from user of either radio with there views.

I also was between buying either rig, but I bought the Kenwood
TS-850S/AT about 3 years ago. I still don't know if I made the
right choice. I have not been able to play with the Yaesu FT-990
so I can not make a good comparison, but here are my views on the
TS-850S:

Things I don't like:
Noise Blankers - there is two, one for the "woodpecker" and one for
regular noise. I have not hear the woodpecker in over 4 - 5 years
so it is useless. The other noise blanker works, but not very well.
I think it was for car noise in a mobile not for home use.

Vox/Breakin CW Keying - During Breakin CW, you can hear a small
relay clicking away. It is annoying even with the headphones.
It you leave CW and go to SSB and forget (as I have several
times) the vox circuit is hot and keys the rig from the audio
that the mike is picking up. I just wonder how many times my
kids and xyl yelling has gone out over the air!

Tuning Rate - The tuning rate was too fast for me, I bought a
kits from International Radio that reduced the tuning rate by
four (a divide by four counter chip) which really was needed.

Things I do Like:
Soft setting of all functions - The TS-850S has a menu system
that allows you to set all parameters of each function view
a menu on the front panel. I like to run FSK 170 shift on
RTTY/AMTOR/PACTOR but 200 SHIFT on PACKET. I can change this
in a matter of seconds via the menu. On the FT-990 you have
to open the case and change a dip switch.

CW/RTTY - I bought this rig for RTTY mainly. I have a 400HZ CW
filter installed along with a 2.4 Narrow SSB filter. Who
every designed this rig had CW in mind. It works better then
any other radio I have had. On RTTY with the 400 hz filter
in the FSK mode I can copy everything. I have won the
Midwest division in the RTTY Roundup Low Power division (rig
only no amp) for the last 3 years with this rig.

Computer Interface - The TS-850S uses the standard Kenwood
command set to talk to the computer. It is simple, straight forward,
easy to use, and maybe a little slow, but all the contest software
has provisions for Kenwood equipment. You can download/upload

all the information in the 100 memories to a computer file. It is nice to have a backup of all that information.

Memories/VFO/Split Frequencies - The TS-850S has 100 memories, 2 VFO's and a 5 memory scratch pad. Each memory can be a full independent VFO. (there is a setting in the menu to make the memories either fixed, or variable). Split freq's can be stored in memories and you can split between bands, 160 receive/10 meters transmit.

Tone Encoder/10 meter FM - Yes it has both and works very well.

Comments on the FT-990. I still like the "Feel" and the looks of the 990 better. The tuning knob and the other controls have a much better feel. I also like the display on the 990 better, its amber lights reminds me of when real radios glowed in the dark. BTW the TS-850 is the first Kenwood radio I have owned. I have had 3 Yaesu's, FTDX-560, FT-101E, and FT757MKI.

I hope this helps and I would like to hear from other 850 and 990 owners with their comments.

Drew:

Many repeater receivers filter-out anything below 300 Hz.
All of my repeater receivers have filters to remove any
user tone, otherwise it would mix with the tone that is
encoded by the transmitter, causing cancellation and
creation of other frequencies.

Jeff,

Depending on the age, the P-110 MIGHT go more channels. Some do, some don't. They made a 2 watt and a 4 or 5 watt depending on VHF or UHF. ALL RADIUS products except P-10, SP-10, P-50 are programmable

CARL
And I thought it was just ME having hard times!!!!!!!!!!!!!!!!!!

I am trying to get my parents to get their ham license. One of them is going to take the test today. I am also planning on taking both of their VISA cards shopping for two new FT-51Rs. Just out of curiosity, have you tried using the CTCSS on more than one repeater? If I were to look at this through the eyes of a troubleshooter, I would say that the repeater might be doing something to your tone as it passes through. The fact that the other guy you talked to recieved your tone may mean that the bandwith of his CTCSS recieve unit might be larger than those found on the Yaesu. Does it do this to all 23 tones? Repeters often take out tones that come in through the input freq. Or like I said, it might just be changing it just enough that your radio can't decode the tone. I think your best bet would be to find another repeater and try it on that, and maybe a few more if you are in an area where there are a lot of repeaters.

Best of luck

Max

The repeater is probably filtering out the CTCSS tones. Many do.
But the filtering is not perfect, so some tone may still get through
which can cause the scheme to work on some radios and not on others
(the tone deviation on one trasmitter may be set a bit higher and
just enough tone squeaks through). You might try moving up in
CTCSS freq since that's where the filtering is usually the weakest
(say 270 Hz).

>Date: Thu, 9 Dec 1993 22:55:53 GMT
>Lines: 61

TM-742/942 Extended TX/RX Modification
ASI-0002, Feb. 23, 1993

This is a summary of the modification provided by Kenwood to expand the transmit/receive ranges for the TM-742/942 tri-band radio. The sheet is ASI-0002, subject "TM-742/942 Beyond Mars/CAP Mod. Guide" and date "February 23, 1993". The actual ranges of what the radio will transmit are wider than what is stated in the table below.

Note: this mod involves desoldering and resoldering chip resistors, if you are not an expert in soldering chip components, get an expert to do this for you.

1. Remove the front panel.
2. Remove the bottom cover from the radio.
3. Looking at the exposed bottom of the radio, orient it so it matches the diagram below.
4. Move the three chip resistors as shown in the diagram. The numbers "1" thru "8" represent the positions of the 8 chip resistors in the original positions from the factory for U.S. radios. The "x" is an empty pair of pads where the numbered "4,7,8" resistors should move to.
5. Reassemble the radio and reset the microprocessor (see manual).
6. Frequency ranges will be:

28 Mhz band: RX: 18.0 - 54.0
TX: 26.0 - 45.0

50 Mhz band: RX: 40.0 - 90.0
TX: 46.0 - 76.0

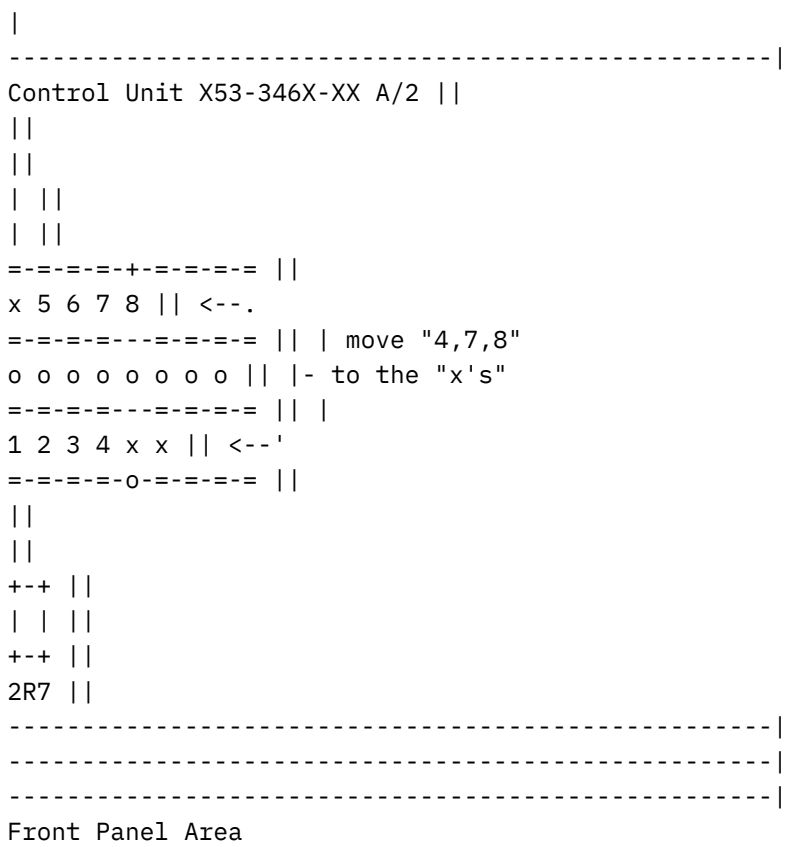
144 Mhz band: TX: 136.0 - 174.0

220 Mhz band: RX: 215.0 - 260.0
TX: 215.0 - 235.0

440 Mhz band: TX: 420.0 - 450.0

1.2 Ghz band: RX/TX: 1100 - 1400

Notes: not all radios will be able to tune the entire range.



END

656. Re: Icom 751a: opinions wanted

Newsgroup: rec.radio.amateur.equipment
Date: 1995-08-15 00:00:00 UTC
From: Joseph Martin Fitter BV/N0IAT <fitr%mimi@magic.itg.ti.com>
Message-ID: <40plll$rm9@tilde.csc.ti.com>
Source record: 213900

I've used an IC-751A for about 4 years now. After doing a side-by side comparison (field day / cw dx contests), I opted for the 751A over the 735. While the 735 is a good solid rig, I found the following to be better on the 751A:

Filters: the 751A has filter cascading and uses dual-if filters.
Power: the 751A loafed along driving the L4B amp with no heating prob.
Meter: the 751A had a bigger front-panel meter
Rcvr: I've found my 751A to be nearly bullet-proof in high RF environs. Also, the passband tuning is circa Collins era and is excellent. In fact, ICOM got into trouble and hence had to modify the circuit in the 735 and 761 to avoid a patent lawsuit. (so I'm told)

I DO have a couple complaints though as follow:

1. Memory and CPU data is stored by lithium battery (not newer eprom technology). Hence, when the battery dies, so does the rig. It requires a trip to the repair shop to replace the battery and reprogram the volatile RAM. Thankfully, mine has yet to die! I'm living overseas, so repair wont be easy if it does go south. I am now investigating the "aftermarket" eprom boards that install inside the rig...the data is burned in the eprom so once you replace the board you never worry again, and at about 100 bucks its cheaper than a trip to the factory!

2. After 1 month, mine developed a quirk. Sometimes, when mode-changing from SSB to CW, the VFO would not lock. A trip to ICOM Service quickly fixed the problem in warranty at no charge...it was a bad crystal that controlled the CW lock. Icom service was so good, in fact, that I had the rig back before I got the little "your rig was received by the repair center" card! Amazing.

3. QSK on the 751A is not "superb". It is good, but the VFO CPU does not lock fast enough to do a lot of split-band / split mode high-speed QSK. This only effects me if working split on 40 meters above about 40 wpm. At that speed, the CPU wont lock fast enough and the first dit of the characters becomes very short. On same-band split (when working most DX) the rig performs very well.

All in all, I'd buy one again. I also use a Yaesu FT-890, Alinco DX70, and have had an FT-1000 and a TS-440. Still like the Icom best.

Programable with "RIB" box and cable and software.

>2) wattage,etc

Programable as well. Generally 5 watts for VHF or 4 watts for UHF.

>3) can you modify it for more channels?

Yes, but I don't think Motorola likes people doing it.

>4) In a related subject, I understand the HT-600/Radius 200 radios
>can be easily modified for 6 channel operation. How do you remove the knobs
>or escutcheon to gain access to the pin you need so the channel switch can rotate to the
>other positions?

You grab the knobs and pull them off. They are friction fit. Some
are very strong. To remove the panel, you just lift it with a screw
driver or knife. It is glued on. If you are careful and don't crease
it, you can then just lay it back down and it will stick.

>tone of somebody else on the freq??

I guess you have heard from enough people that have said that not all
repeaters pass PL tones. Some do pass it. Some strip it off. And some
strip it off and generate their own.

Perhaps it is just the audio response of the repeater.

You said it works on simplex - your radio is sending the tone with enough
deviation to open the squelch on your wife's radio.

You said it does not work thru the repeater to your wife's radio - the
low frequency CTCSS tone may be attentuated through the repeater and the
deviation is too low to open her tone squelch - this is quite possible.

It worked through the repeater to someone elses radio - that person's
radio may be capable of decoding CTCSS at lower deviation.

Typically, CTCSS tone is at about 500 HZ deviation. Many newer radios
can handle it lower than that - but probably not much lower.

I'd say gin up a set using a good graphics editor and a laser printer.
But that is not the way to learn code, even for young kids. It has to
be a 'hear it write it' reflex thing. There is no time when copying
code to visualize a flash card or a chart, etc.

I was planning on purchasing an RC-1000 repeater controller for use in a GE Mastr II UHF application. Does anybody have any opinions on this controller, good or bad? Or are there better controllers for the same price?

Thanks for any help offered.

>73 Ed

I was going to respond with a similar comment. However, after reading
his post several times, it became a real mystery. Remember (and you
apparently missed this), he was able to have someone else (besides his
wife) trigger his receiver VIA THE REPEATER, and he was able to
trigger the other person's receiver. I had originally thought that
since most repeaters either purposely don't pass pl, or just pass it
so poorly that it won't work, maybe the other person's pl was very hot
and forced its way through. However, that is negated by the fact that
HE was able to use HIS ht to trigger the other one. The only one that
doesn't seem to work is the path between him and his wife, either
direction.

I'm curious to see what the outcome of this is :)

>costs as much as this sounds so cheap.

Yaesu has a mod to fix this. As with all new designs theres sometimes bugs
to work out. The audio seems to be echoing around inside the "pickel" making
it bassy. I sent mine in to Yaesu and they fixed it at no charge. On air reports
say it's 100% better and sounds great.

With the new mike comming out for the 8500 there wont be this problem as it
is not as big and hollow as the "pickel". It's standard size.

Source record: 213759

elekesa@cadvision.com (elekesa) wrote:

>Would anyone know of any mods for the IC-Z1A HT?

> Thanks
Here's a repost of the Z1A mods:

Ok, after messing around with the radio on my own and then getting the
"official" mod, here's a summary of the various diode mods for the Z1A:

Icom Z1A mods

[B]+[#]+[POWER] = Extended Receive.
VFO *DISPLAYS* 50-299.900 and 300-999.900.
AM Aircraft band enabled.
SET mode now has a new "PLACE" function for setting
the direct entry starting digit.

There is room for four diodes in the Z1A located on the CPU board to the left
of the ribbon cable connector. On a US version, only the bottom two are
installed. D15 is just below and to the right of the four diodes. These
diodes are bigger than the rest of the surface mounted components and are easy
to spot.
The official ICOM mod (which I unofficially saw...) is to remove D15 for
extended TX and to use the above keyboard mod for extended receive. According
to the sheet, the 800-900 band is NOT available in US versions.

```
+-+ +-+
| | | | <---- Installing diodes in either of these seems to do
+-+ +-+ nothing.

+-+ +-+
| | | | <---- IN: US Version 144-148 TX 440-450 TX
+-+ +-+ OUT: Extended 136-174 TX 380-470 TX (Lose auto-repeater
^ and tone encode)
|
+------------ IN: US 144-148 TX 440-450 TX
OUT: European 144-148 TX 430-440 TX

+-+
"D15"--> | | <---- IN: US Version Stock
+-+ OUT: Extended TX 136-174 380-470 (keeps auto-repeater
and tone encode)
```

A word of warning about messing with the four diode pads: If you detach
either one of the installed diodes, the CPU will reset and you'll lose ALL of
your memories. (found that out the hard way...) D15 doesn't seem to affect

the memories at all.

Since the 800MHz band is not available in US versions, my guess is that there's a keyboard mod to unlock it instead of a diode. The diodes only seem to control the country versions. If anyone has any more keyboard mods, please post them.

Hi.

I recently acquired on loan a Hull 5150 SSB Marine HF Transceiver.
Unfortunately it did not come with a manual.

It has an rs232 type connector at the back as well as an accessory sockets. The front panel contains a 16 key pad , a lcd frequency display, and a tuning and mode knobs.

I would like to know the protocol for the rs232 connector, and also how one can control the rf gain on both transmit and receive in this device.

I would very much appreciate hearing from anyone with experience or information on the rig

Thanks
Stephen Pearce

Yes. IC751A is vy good rig. I agree with Joe.
There has been some tests abt the rig and the results have been
suberb. We are also tested 765 and 751A and we didnt find any
big differences, both are very good.

We have to remember that model 751 is not same as 751A which has
better rx (same as in IC-R71 ?)

: I'm undecided between buying a new Yaesu FT-840 and the ICOM IC-735
: which I can find used for about the same price ($800).

: They both have Gen.Cov. Receiver and dual VFO. I'm concern about
: reliability and signal clarity on the air.

: Which one do you think is a better choice ?

I would not vote in favor of the Icom 735. I had one for a couple of years, and was *never* impressed with its receiver. The 735 design seemed to incorporate a great deal of synthesizer noise, resulting in a poor noise floor (making weak signal reception difficult) and what I perceived as a poor dynamic range.

In addition, I came to hate the little slide pots under the front cover: difficult and touchy to adjust.

Personally, I would recommend against the Icom 735 (and the Kenwood 140s as well, for what it's worth).

Good luck!

: and talking to a few people (including ICOM service), I'm confused. I've
: been told that "the 751a was the best radio Icom ever made." I've also
: been told that the just-discontinued IC-735 receiver will outperform the
: 751a, that the 751a runs hot, and that the 751a has a similar front end to
: the 745 and may have similar overload problems.

Peter -

I can only coment on one aspect of your posting. I owned a 735 for a couple
of years, and have had the opportunity to operate a friend's recently
purchased 751a. There is simply *no way* that the 735's receiver is as
good as, or better than, the 751a's receiver.

When using the 735, I always thought it was a mediocre, noisy receiver -
I never missed the rig after I sold it. The 751a always seemed more
sensitive and less noisy; personally I'd buy one in a second *if* I could
afford it.

Good luck!

I just got a Kenwood TW-4100E and I am looking for the functions of the
diodes in the frontpanel. I found mods for TX/RX extention with the diodes
D6 (UHF) and D8 (VHF).
In my 4100E version are the D1, D2, D3, D4 and D5 already removed and
in the 4100A version are the D3, D4, D5 and D7 already removed.
So I am looking for functions of these diode if they are installed/removed.

I need a schematic of a O-330A/FR or a VOX-5 variable master oscillator.
It seems to be for diversity receivers with a variable outputs of 2 to 64
MHz , two crystal oscillatos and a BFO. A two stage oven keeps the variable
oscillator stable. Each oscillator has 3 outputs as well.

684. HQ-170C Parts Needed

Newsgroup: rec.radio.amateur.equipment
Date: 1995-08-16 00:00:00 UTC
From: GeorgeZiga@oai.org
Message-ID: <GeorgeZiga-1608951200510001@wanderer1.oai.org>
Source record: 213771

I have an HQ-170C receiver, circa 1958 that I "acquired" in 1961, used for about 15 years, and then put on a shelf after it blew its power supply. I'm thinking about working on it as a project when the snow flies, and am looking for the requisite parts (or a source of parts that I can contact) to repair the unit. Here they are:

Part Description Part Number

T12 160M Antenna Coil K38926-1

T27 Power Transformer P26305-1

L6 8 Hy Filter Choke K26302-1

I realize I can find other power transformers and chokes to work in the receiver, but I'd rather use OEM parts so I don't have to drill more holes, make more mess, and disturb who-knows-what. :^)

Any help would be appreciated. Please reply directly via email.

Thanks... WA8AJL

Source record: 213772

Although I plan to hang on to my "antique" Drake R-4/T-4X, it looks like it's about time to get something more modern.

Right now, I'm giving top consideration to the Yaesu, but would like comments about both. Yaesu claims theirs to be preferred by DXers worldwide, but that's their own ad.

I am not consideraing the top-of-the-line Kenwood rig at this time, but would also be willing to hear opinions about it.

Thanks in advance,

Jim

Just got a JR500S ham band only receiver at ham fest. It is a tube type
receiver perhaps made in the 60's. Seems to work well,needs
alignment,considering it looks like it had been stored in a damp basement.
I need a schematic and maybe specs on it. Can anyone help me out?
Hope to use it with a simple cw transmitter to help some young novice
operators (tech +) get started doing something other than using their HT's.

>charge a battery with the trickle charge?

Overcharging has nothing to do with the "memory" phenomenon. Memory
is indeed virtually a thing of the past, and something amateurs can
typically ignore, but overcharging is altogether something else. It
causes several problems. One problem that overcharging creates that
looks like memory is the voltage depression effect. Other effects
range from drying out the battery due to heating to passivating the
cell plate structure through chemical side chain reactions. Overcharging
is *bad*, and will drastically shorten battery life.

You should use your battery until the radio complains, then recharge
it at the C/10 rate for 14 hours, no more. Alternately, a *good*
pulse charger can recharge a battery in any state of charge to its
full capacity and then switch off. Unfortunately, this type of charger
is not common. The Yaesu NC-42 was an example, but other Yaesu chargers
didn't do this properly. I don't know if Yaesu has a proper charger for
the FT51R batteries.

>I also have a question about another type of charger that I bought used. It is
>a little different than the EDC 12. It replace the battery completely. It's
>plug for the cigaret outlet has a green led on it, but appears to be a standard
>plug. Other wise, the part that replace the battery is about the size of the
>9.6v battery. It is very light, as if empty. What exaclty is this? Why does
>it only give 8v of output power?

The housing is indeed empty. The regulator is built into the cigarette
lighter plug. A regulator is necessary when running off the auto electrical
system because voltages much higher than 13.6 volts can be found there from
time to time, ranging from 14.8 volts during vehicle battery charging to

300+ volt spikes during engine starting. These would trash your radio.
The likely reason it regulates to the lower voltage is that the manufacturer
knows you'll use the radio more in the vehicle than you would off batteries
and he is trying to limit the heating the radio would experience at the
higher voltage and duty cycle.

Source record: 213776

Ok, guys, I'm trying to find a better radio to mount in my
Jeep Cherokee. The old Alinco just doesn't fit very well.
I'm looking at the Standard 718 and Yaesu 8500 that both
have the controls in the microphone. The Standard has the
display in the microphone too, which simplifies dealing
with the radio (just throw it under the seat), but I'm
looking for some practical experience, pro and con, on
these two rigs. What do you think?

This is an experiment to see how much response I would get if I offered
a tuning/alignment service for any of the following radios for a flat
fee of $15.00. Customer supplies shipping.

(any band)

Motorola: Mitrek
Micor
Mocom-70
Mocom-30
Motran
Motrak

I would also order xtals and compensate channel elements for extra fee

I could also get pl reeds.

I would tune duplexers or cavities for a flat fee of $20.00

If this sounds interesting to you please send me some e-mail to let me know!

Thanks,

Scott Sidener N0WFL sidener@umr.edu

There is no "bogus" Atlas company. The original owner of Atlas has restarted his company. If you check 73 or CQ magazine - there is an ad every month for the new Atlas rig. But, no, I have not seen one in operation yet, nor heard one on the air. I suspect that they got in over their heads and just haven't gotten out yet and gone into production. Not a good way to do business. Hope that they cover the guys who have sent in advance money.

The current Atlas company may indeed be run by the original owner; I have no information at this point to the contrary. However, there were two scams operated under the Atlas name in the '80's; these were not operated by the original owner. I cannot recall the perpetrator's name offhand, but the last scam he ran was shut down by the postal inspectors in 1989. He advertised in 73 magazine (and possibly CQ--I'm not sure) for a new Atlas rig, but he simply took the money and never delivered anything. He was convicted of mail fraud and sentenced to prison time and a fine. He had pulled the same scam several years earlier, and was convicted and sentenced for same.

As I said, I don't know anything about the current Atlas company or the ads in 73 and CQ. If it is in fact the same person who pulled the two earlier scams, it would seem he has not learned his lesson and is a good candidate for "three strikes and you're out" (since mail fraud is a federal offense, this could apply).

Have you heard of the QRP-L mailing list? There has been quite a bit of discussion lately on the QRP Plus, as well as the Norcal and others.

To subscribe, send mail to: listserv@lehigh.edu

and in the body: subscribe QRP-L Yourfirstname Yourlastname

This must be where the QRP rigs are discussed; there has not been much said on this newsgroup, as far as I recall.

I am considering the QRP Plus myself. It has full 160-10M coverage, including the WARC bands, and can switch bands without changing plug-in modules.

I have one and love it! I haven't used every function available, but of the ones I do, very simple to use and program. I've even been messing around with some of the remote programming stuff.

I've put in the suggested mods, and it's OUTSTANDING!

I can't compare it with anything because it's the only mobile I've ever used.

I got this radio a couple of months ago, along with a IC-2340H.

Got mods for the 2340H, but would like to see something on the 'ole
31A too.

Have any of you looked into it? I don't have a service manual for
the HT, and don't know about any Key-Pad mods...

Gary, I just installed the 8500 in my Cherokee.. I mounted the radio under
the drivers seat - lots of room and it should get lots of air flow. Just 4
nuts and the seat comes out. The display is mounted in the long thin
cup just below the ash tray and behind the ash tray. The mic is mounted
on the left-hand side of the shifter, where the 4WD shifter should go. I need
find out about the audio fix for the mic (I was just told that YAESU has a
fix for it) nice rig so far..

I've forwarded the info to both friends. Thanks.

Yes, there are bugs that need to be worked out many times but it would be
nicer if these bugs were fixed before the radio makes it to the retail shelf.

Maybe I'm expecting too much...

: appreciated.

This is an easy one. Find a sensitive, microamp meter like the one out of
an old VOM. Put a crystal diode across it. Connect a short piece of wire
to one of the terminals for a antenna. I used one for many years. If it
reads backwards, reverse the diode. If you want to really get fancy,
put a reostat in series with the diode. Thats all there is to it.

>
>Thanks in advance,
>
>Jonathan Sacoolas KC7MIZ
>sacoolas@usc.edu

Hi Jonathan...

Tempo is/was a line of equipment manufactured overseas and marketed primarily by Henry Radio in Los Angeles in the 1970's. To the best of my knowledge, there isn't any recent Tempo ham gear, but Henry is still around and still provides some service on the Tempo line.

The S5 HT is a higher-output power version of the earlier S1. Both HTs are thumbwheel-set (i.e. you dial up a frequency by setting thumbwheel switches on the top of the HT) single frequency no frills radios. The S1 was a nominal 1.5w out, while the S5 was a nominal 5w out. PL has to be added on, there are no memories or scan capabilities, no display or S-meter - just a single LED that goes out when the battery is dead. Most of the S-series HTs that I have seen have Touch-tone pads, but only 12 key - no ABCD keys.

If you live in an area with a limited number of non-PL repeaters, the S5 might be a good starter rig, if the price is low enough. If you want or need more features, you'll have to go somewhere else.

If you do buy it, make sure the seller gives you the wall-wart battery charger...

My $0.02

I own a 735, which I consider to be a good, not great radio. As some
have already pointed out, the receiver sounds noisy, probably due to
the noisy PLL frequency generation scheme. However, it does have two
features that the current entry-level radios don't have: VOX and an
RF gain control.

I just find it unbelievable that manufacturers, in 1995, would not put
those two features into a radio. These were standard features on $300
equipment over 25 years ago!

>ne1h@tornado.ne1h.radio.org
>

Alan, as I remember it, the RUS (Received Unsquelched Signal) is active only if the
Channel Guard (PL) is activated on receive. The CAS (Carrier Activated Squelch) is
active whenever a carrier is present.

It sounds to me like you have the repeater operating and only need to add a hang
time to the transmitter. This should hold the transmitter for one to three seconds
after the CAS drops. Most repeater controllers do this and have programable hang times. Are
you using a repeater controller, or a homebrew COR (Carrier Operated Relay)?
If you are using a COR, you'll need to have the time delay added to it.

Good luck!

> What should I be looking for to set up a personal phone patch?
>
> I'll run a 2m rig continously, on a simplex freq. but do'nt know much
> about it beyond that.

Paul -

The principal commercial supplier of simplex patch interfaces is CSI (Connect Systems Inc), who has a couple of grades of simplex patches. These should be available from the popular ham stores. These interfaces handle most of the requirements to stay within the Rules including polled break-in for operator (your) control, access password, and station ID. Expect to pay $300 and up, depending on features.

But other than that, you've got a problem...2m simplex autopatch is illegal, and there are some who contend that all simplex autopatches are illegal.

The first problem (the 2m thing) is that in an autopatch setting, your home/base station becomes an "auxiliary station". Auxiliary stations may not be operated below 222.150 MHz (also not in 431-433 and 435-438 MHz). 2-meter simplex autopatches are probably out there, but they are still nonetheless illegal.

The other problem is that some have interpreted the rules to construe that the home (auxiliary) station operating under simplex autopatch is an automatic station. Automatic stations are not allowed to participate in 3rd-party traffic ("3rd-party" being the person on the other end of the telephone).

(I disagree with this point, because I contend that the station with the simplex autopatch is a remotely-controlled auxiliary station and not an automatic station - an important distinction. However, I do have to acknowledge this particular point of view since one strong advocate is in a position of some authority on the Rules - a member of the FCC Amateur Auxiliary, whose responsibility is to keep us all on our toes about the Rules. But I'm a certified AmAux member, too, so take your pick. ;-))

The purely practical side is that if simplex autopatches were plainly illegal, CSI wouldn't be offering them for sale. I'd say get a CSI box and set your system up on 222 or above, and enjoy.

Sounds to me like a combination of several conditions. Normal repeater audio processing will roll-off the low frequencies unless they've specifically been tweaked to pass PL tones. I've had good luck passing tones above 150 Hz through most repeaters, so if Test A worked and Test B did not, check to see what tones were being used.

Also, Kenwood radios are known for having extra-hot PL injection (and no way to adjust it, unfortunately), so if the "it worked" test involved a Kenwood rig on the other end, that could be an explanation, as well.

Drew might want to try tones at the higher frequencies and see if they work with the Yaesu radios.

>about it beyond that.

Well the first thing you should know is that you need to run this
above 222 MHz. It's illegal on 2 meters unless you have a control
operator at the patch, or use a separate 222 MHz or above radio for
control purposes. If you run it above 222 MHz, it falls under
the Auxillary rules and *you* can be the control operator from the
rig you use to talk to it.

This is simply a broadband active antenna (from MW up through shortwave and perhaps a bit beyond). This unit came out quite a few years ago and has been upgraded slightly during this period.

It is still manufactured and has always got excellent reviews, whether in Passport, the WRTH or Rainer Lichte's Chance or Choice. As to how it compares to the current crop, I would guess that it definitely is inferior to the high-end Dressler and RF Systems units but it is a whole lot cheaper (roughly listed at US$200). It is however *way* superior to the Radio Shack Sony and MFJ toys.

Try this FTP ftp://kilroy.jpl.nasa.gov/pub/hamradio/mods/

There are three files under the YAESU directory. They are ft51r.mod, ft51r-1.mod and ft51r-2.mod. I think they contain most of the mods that have been released so far. Be aware that you may have some problems with doing the hardware mods. I did the expanded receive when I first got my 51R and found that I could no longer load and save profiles on the software package that I bought with it. I fixed it back and have not played with it much since. From what I heard it does not really receive that well beyond the extended receive that is already built into the radio. One of the three files that you can download states what the reception is like when the receiver is hardware expanded. 73's ....Floyd (WD5ENJ)

Paul,

I have run a CSI model CS-900 connected to a Alinco DR-590 on the VHF side for about a year and am very happy with it. (I call it my poor-man cellar) I keep the radio on a simplex freq. with tone Sql. on so others that may use the same freq. don't come into the house.
It is not quite a slick as a repeater autopatch but when the person on the phone understands the "you talk - then I talk" protocal it works fine. This setup can be run through a repeater that passes DTMF tones (not many do) or you can set up a call for someone on a repeater through your radio.
I connected the audio from the speaker jack to the CS-900 through a relay to an external speaker, and a 8-pin mic cable to a breakout box and run audio and PTT in parallel with the reg. mic. I use the radio as a base station with no problems and when I'm done just push the call button to get back on the simplex freq. The CS-900 has a 99 no. speed dial and has toll restrictions and can ring out on the air with your call or Tel. tone. I have set it up where I can call into the house and access the radio to call my wife while she's in the car.

I think I paid new $329.00 for the unit and for our needs it works fine. I work 3 miles from home and with 3 kids and all the ballparks and stuff we do around the neighborhood it is a good alt. to a real phone.

745. Heath HD-20 Crystal Calibrator info needed

Newsgroup: rec.radio.amateur.equipment
Date: 1995-08-17 00:00:00 UTC
From: tdrumm@sparc.isl.net
Message-ID: <410s2k$mv9@news.isl.net>
Source record: 213683

I have an old Heathkit HD-20 100KHz Crystal Calibrator from my first time in ham radio (circa 1971). Somewhere along the line, I lost the manual for it. Luckily, I didn't have the same problem with my HW-16! Anyway, does anyone know anything about it? I have a few questions. It used some old-style battery which had clips like a 9V, but I think they were on each end. Does anyone know what voltage it was? Also, I'd like to know the adjustment procedure. I imagine it's done using WWV but, ahem, it's been a while!

I have it and it might be nice to be able to use it!

Thanks,
Tony - AA0SM

Subject: FT-840 vs IC-735

ANDRES MARTINEZ (amnet@ix.netcom.com) wrote:
: I'm undecided between buying a new Yaesu FT-840 and the ICOM IC-735
: which I can find used for about the same price ($800).

: They both have Gen.Cov. Receiver and dual VFO. I'm concern about
: reliability and signal clarity on the air.

: Which one do you think is a better choice ?

I would not vote in favor of the Icom 735. I had one for a couple of
years, and was *never* impressed with its receiver. The 735 design seemed
to incorporate a great deal of synthesizer noise, resulting in a poor
noise floor (making weak signal reception difficult) and what I perceived

as a poor dynamic range.

In addition, I came to hate the little slide pots under the front cover:
difficult and touchy to adjust.

Personally, I would recommend against the Icom 735 (and the Kenwood 140s
as well, for what it's worth).

Good luck!

Subject: FT-8500 question

>The transmitted audio on these radios (at least the three I've heard)
>has absolutely SUCKED. It is very bass sounding and muffled, bordering
>on distorted. I'm not impressed by this and wonder why a radio that
>costs as much as this sounds so cheap.

Yaesu has a mod to fix this. As with all new designs theres sometimes bugs
to work out. The audio seems to be echoing around inside the "pickel" making
it bassy. I sent mine in to Yaesu and they fixed it at no charge. On air
reports
say it's 100% better and sounds great.

With the new mike comming out for the 8500 there wont be this problem as it
is not as big and hollow as the "pickel". It's standard size.

: been told that "the 751a was the best radio Icom ever made." I've also
: been told that the just-discontinued IC-735 receiver will outperform the
: 751a, that the 751a runs hot, and that the 751a has a similar front end to
: the 745 and may have similar overload problems.

Peter -

I can only coment on one aspect of your posting. I owned a 735 for a couple
of years, and have had the opportunity to operate a friend's recently
purchased 751a. There is simply *no way* that the 735's receiver is as
good as, or better than, the 751a's receiver.

When using the 735, I always thought it was a mediocre, noisy receiver -
I never missed the rig after I sold it. The 751a always seemed more
sensitive and less noisy; personally I'd buy one in a second *if* I could
afford it.

Good luck!

Subject: O-330A/FR or VOX-5 schematic needed

I need a schematic of a O-330A/FR or a VOX-5 variable master oscillator.
It seems to be for diversity receivers with a variable outputs of 2 to 64
MHz , two crystal oscillatos and a BFO. A two stage oven keeps the variable
oscillator stable. Each oscillator has 3 outputs as well.

Subject: TSQ on 51r will not work thru a repeater???

I am trying to get my parents to get their ham license. One of them is
going to take the test today. I am also planning on taking both of their
VISA cards shopping for two new FT-51Rs. Just out of curiosity, have you
tried using the CTCSS on more than one repeater? If I were to look at
this through the eyes of a troubleshooter, I would say that the repeater
might be doing something to your tone as it passes through. The fact that
the other guy you talked to recieved your tone may mean that the bandwith
of his CTCSS recieve unit might be larger than those found on the Yaesu.
Does it do this to all 23 tones? Repeters often take out tones that come
in through the input freq. Or like I said, it might just be changing it
just enough that your radio can't decode the tone. I think your best bet
would be to find another repeater and try it on that, and maybe a few more
if you are in an area where there are a lot of repeaters.

Best of luck

Subject: FT-840 vs IC-735

ANDRES MARTINEZ (amnet@ix.netcom.com) wrote:
: I'm undecided between buying a new Yaesu FT-840 and the ICOM IC-735
: which I can find used for about the same price ($800).

: They both have Gen.Cov. Receiver and dual VFO. I'm concern about
: reliability and signal clarity on the air.

: Which one do you think is a better choice ?

I would not vote in favor of the Icom 735. I had one for a couple of
years, and was *never* impressed with its receiver. The 735 design seemed
to incorporate a great deal of synthesizer noise, resulting in a poor
noise floor (making weak signal reception difficult) and what I perceived

as a poor dynamic range.

In addition, I came to hate the little slide pots under the front cover:
difficult and touchy to adjust.

Personally, I would recommend against the Icom 735 (and the Kenwood 140s
as well, for what it's worth).

Good luck!

>The transmitted audio on these radios (at least the three I've heard)
>has absolutely SUCKED. It is very bass sounding and muffled, bordering
>on distorted. I'm not impressed by this and wonder why a radio that
>costs as much as this sounds so cheap.

Yaesu has a mod to fix this. As with all new designs theres sometimes bugs
to work out. The audio seems to be echoing around inside the "pickel" making
it bassy. I sent mine in to Yaesu and they fixed it at no charge. On air
reports
say it's 100% better and sounds great.

With the new mike comming out for the 8500 there wont be this problem as it
is not as big and hollow as the "pickel". It's standard size.

Subject: Hull 5150 SSB transceiver

Hi.

I recently acquired on loan a Hull 5150 SSB Marine HF Transceiver.
Unfortunately it did not come with a manual.

It has an rs232 type connector at the back as well as an accessory sockets.
The front panel
contains a 16 key pad , a lcd frequency display, and a tuning and mode knobs.

I would like to know the protocol for the rs232 connector, and also how one
can control
the rf gain on both transmit and receive in this device.

I would very much appreciate hearing from anyone with experience or
information on the rig

Thanks

: been told that "the 751a was the best radio Icom ever made." I've also
: been told that the just-discontinued IC-735 receiver will outperform the
: 751a, that the 751a runs hot, and that the 751a has a similar front end to
: the 745 and may have similar overload problems.

Peter -

I can only coment on one aspect of your posting. I owned a 735 for a couple
of years, and have had the opportunity to operate a friend's recently
purchased 751a. There is simply *no way* that the 735's receiver is as
good as, or better than, the 751a's receiver.

When using the 735, I always thought it was a mediocre, noisy receiver -
I never missed the rig after I sold it. The 751a always seemed more
sensitive and less noisy; personally I'd buy one in a second *if* I could
afford it.

Good luck!

Source record: 213687

When we got married (14 years ago) my wife bought herself a TS-530S, and her dad had a Yaesu FT-101. A few years later he got a TS-430. After 6 or 8 years, the TS-430 became intermittent, and her dad gave it to us when he bought a TS-440AT. The TS-430 stopped being intermittent when I made a (full-power) FM xmission on 10 meters. For $60 Kenwood soldered the finals back in and repaired the PWB and the rig has worked flawlessly ever since.

A few years ago, the TS-440 started acting up, and my father-in-law gave it to us when he got a TS-450AT. I changed out the recommended parts in the VCO5 circuit, and got it working (more or less).

Last week, his TS-450 stopped transmitting. He bought another one and is getting the first one fixed. My question is: except for the TS-530S (which was still working perfectly when we sold it last year) the other Kenwood products haven't looked too good. Is this typical? (Not that I am complaining!) ;-)

>for ? Should I get some ? Which ones ?
>Thanks !
>P.S. I do plan to do CW operation.

The TS-450S/AT comes with a 12 khz filter for FM, 6 khz filter for AM, and one 2.4 khz filter for ssb. You can optionally add in three additional filters. You add an additional ssb filter and two cw filters. Kenwood makes a couple of choices for each. Each filter narrows the bandwidth of the signal passed to through the various intermediate stages of the radio basically chopping off what is outside of the filter bandwidth centered on the radio receive frequency. If you are going to do CW, I would strongly suggest you add a 500 hz CW filter in one of the two CW slots. On a very crowded band, you might consider the narrower option of 270 hz although the quality of the signal passed is pretty poor. For ssb, I added a 2.1 khz filter which allows me to tighten down slightly on the already included 2.4 khz filter making some crowded conversations receivable.

The 450 is a great rig. I hope you get as much enjoyment out of yours as I have had from mine.

Dale...

To do CW, you will need to add a filter for CW that is not included in the rig out of the box. There are several options. I have a 500 hz filter installed and it has really helped a lot. Think there is also a 270 hz option. That would be a bit tight but then again might help get a signal out of a crowded band.

Date: 16 Aug 1995 16:00:46 GMT
From: GeorgeZiga@oai.org (George R. Ziga)
Subject: HQ-170C Parts Needed

I have an HQ-170C receiver, circa 1958 that I "acquired" in 1961, used for
about 15 years, and then put on a shelf after it blew its power supply.
I'm thinking about working on it as a project when the snow flies, and am
looking for the requisite parts (or a source of parts that I can contact)
to repair the unit. Here they are:

Part Description Part Number

T12 160M Antenna Coil K38926-1

T27 Power Transformer P26305-1

L6 8 Hy Filter Choke K26302-1

I realize I can find other power transformers and chokes to work in the
receiver, but I'd rather use OEM parts so I don't have to drill more
holes, make more mess, and disturb who-knows-what. :^)

Any help would be appreciated. Please reply directly via email.

Thanks... WA8AJL

753. PRODUCT REVIEW: PALOMAR ENGINEERS R-X NOISE BRIDGE (model RX-100)

Newsgroup: rec.radio.amateur.equipment
Date: 1995-08-18 00:00:00 UTC
From: mc@shore.net
Message-ID: <4128mo$gas@northshore.shore.net>
Source record: 213605
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.antenna

PRODUCT REVIEW: ANTENNA RX NOISE BRIDGE, Palomar Engineers model RX-100

With all the new technology "appliance" radios on the ham radio market today it seems to me that the only area left for H.F. experimentation is antennas. Most hams have a SWR meter and perhaps a Wattmeter, but little else to perform tests on the antenna and feedline to learn its characteristics, resonant frequency, etc.

PALOMAR ENGINEERS' R-X Noise Bridge is not a new product - its been around for a long time. Basically, the Noise bridge will tell you if your antenna is resonant or not at any specific frequency between 1 and 100 MHz. If it isn't, the instrument will tell you if it is too long or too short. It works with dipoles (trapped and monoband), verticals, beams, quads, inverted Vees. If it resonates, the R-X Noise Bridge will measure it.

Your SWR bridge will show you a ratio like 2:1 but it won't tell you much more. The noise bridge measures both resistance and reactance and if the antenna is not resonant at the frequency you want, it will tell you how much of the impedance is resistance and how much is reactance. Unlike SWR bridges, the R-X Noise Bridge works with all coaxial feedlines.

The Palomar R-X Noise Bridge is easy to use. Install a 9 Volt battery. You connect your receiver or transciever to the SO-239 connector marked "RCVR" Make sure to turn the VOX off or you may be sorry! Connect your antenna with a short piece of feedline to the connector marked "UNKNOWN". Tune your receiver to the anticipated resonant frequency and turn the Noise Bridge on. A loud "rushing" noise will be heard. There are two controls on the noise bridge - R and X. Adjust these two controls for a sharp drop or null in the noise. You might want to turn off the receiver AGC for this test. The controls interact and should be adjusted alternatively.

The R control is marked from 25 to 250 and the X control is marked 70 to 70 with 0 being at the 12 o'clock position. Figures to the right of center indicate inductive reactance, left indicate capacitive reactance. After tuning for your null, read the two controls. If the noise bridge shows the antenna to be inductive it is too long for this frequency; capacitive means it is too short. If you want to find out the resonant frequency set the X control at 0 and the R control at 50 and tune the receiver for the null.

You can also measure the antenna when its up in the air, but you'll have to do a bit of figuring to take into account the feedline's electrical length. The manual will explain how to do this. You can also use the PALOMAR ENGINEERS' R-X NOISE BRIDGE to cut a piece of coax to exact quarter and

half-wave lengths, measure feedline impedance, test baluns for frequency range, ratio and whether or not they are working. The manual outlines all these functions in a clear step-by-step fashion. In fact, the RX-100 comes with manuals in English, Spanish and Japanese. That's a switch!

PALOMAR ENGINEERS also offers a computer program called SmartBridge that makes using the RX-100 a lot easier to use and interpret. I will be reviewing it in the very near future.

I found the Noise bridge very easy to use and versatile as well. One of its uses is to set the controls on your antenna tuner without turning on your transmitter. Connect the "unknown" connector to your tuner. Set the noise bridge controls to X = 0 and R = 50. Tune your receiver to the desired frequency. Adjust the tuner controls for the noise null. Record the tuner readings for future reference.

The PALOMAR ENGINEERS RX-100 NOISE BRIGE is extremely well constructed. The case is cast aluminum, component parts are all very high quality and its obvious that it was built to last. At $80.00 it represents a good investment in a useful antenna measurement instrument that will prove useful time and time again. For more information or a copy of the manual ($2.00) contact PALOMAR ENGINEERS, PO Box 462222, Escondido CA 92046. Telephone 619-747-3343.

Sure, a lot of them can be modified to go to the commercial bands.
But dont get caught. The fine is pretty stiff.

Subject: FT-840 vs IC-735

ANDRES MARTINEZ (amnet@ix.netcom.com) wrote:
: I'm undecided between buying a new Yaesu FT-840 and the ICOM IC-735
: which I can find used for about the same price ($800).

: They both have Gen.Cov. Receiver and dual VFO. I'm concern about
: reliability and signal clarity on the air.

: Which one do you think is a better choice ?

I would not vote in favor of the Icom 735. I had one for a couple of
years, and was *never* impressed with its receiver. The 735 design seemed
to incorporate a great deal of synthesizer noise, resulting in a poor
noise floor (making weak signal reception difficult) and what I perceived
as a poor dynamic range.

In addition, I came to hate the little slide pots under the front cover:
difficult and touchy to adjust.

Personally, I would recommend against the Icom 735 (and the Kenwood 140s
as well, for what it's worth).

Good luck!

Subject: FT-8500 question

>The transmitted audio on these radios (at least the three I've heard)
>has absolutely SUCKED. It is very bass sounding and muffled, bordering
>on distorted. I'm not impressed by this and wonder why a radio that
>costs as much as this sounds so cheap.

Yaesu has a mod to fix this. As with all new designs theres sometimes bugs
to work out. The audio seems to be echoing around inside the "pickel" making
it bassy. I sent mine in to Yaesu and they fixed it at no charge. On air

reports
say it's 100% better and sounds great.

With the new mike comming out for the 8500 there wont be this problem as it
is not as big and hollow as the "pickel". It's standard size.

Subject: Hull 5150 SSB transceiver

Hi.

I recently acquired on loan a Hull 5150 SSB Marine HF Transceiver.
Unfortunately it did not come with a manual.

It has an rs232 type connector at the back as well as an accessory sockets.
The front panel
contains a 16 key pad , a lcd frequency display, and a tuning and mode knobs.

I would like to know the protocol for the rs232 connector, and also how one
can control
the rf gain on both transmit and receive in this device.

I would very much appreciate hearing from anyone with experience or
information on the rig

Thanks
Stephen Pearce

Peter A. Klein (pklein@news.seattleu.edu) wrote:

: Based on the above, I've thought about getting a used Icom 751a. However,
: after reading the ARRL Radio Buyer's Sourcebook (reprinted QST reviews)
: and talking to a few people (including ICOM service), I'm confused. I've
: been told that "the 751a was the best radio Icom ever made." I've also
: been told that the just-discontinued IC-735 receiver will outperform the
: 751a, that the 751a runs hot, and that the 751a has a similar front end to
: the 745 and may have similar overload problems.

Peter -

I can only coment on one aspect of your posting. I owned a 735 for a couple
of years, and have had the opportunity to operate a friend's recently
purchased 751a. There is simply *no way* that the 735's receiver is as
good as, or better than, the 751a's receiver.

When using the 735, I always thought it was a mediocre, noisy receiver -
I never missed the rig after I sold it. The 751a always seemed more
sensitive and less noisy; personally I'd buy one in a second *if* I could
afford it.

Good luck!

Subject: Mods wonted for TW-4100

I just got a Kenwood TW-4100E and I am looking for the functions of the
diodes in the frontpanel. I found mods for TX/RX extention with the diodes
D6 (UHF) and D8 (VHF).
In my 4100E version are the D1, D2, D3, D4 and D5 already removed and
in the 4100A version are the D3, D4, D5 and D7 already removed.
So I am looking for functions of these diode if they are installed/removed.

Subject: TSQ on 51r will not work thru a repeater???

I am trying to get my parents to get their ham license. One of them is going to take the test today. I am also planning on taking both of their VISA cards shopping for two new FT-51Rs. Just out of curiosity, have you tried using the CTCSS on more than one repeater? If I were to look at this through the eyes of a troubleshooter, I would say that the repeater might be doing something to your tone as it passes through. The fact that the other guy you talked to recieved your tone may mean that the bandwith of his CTCSS recieve unit might be larger than those found on the Yaesu. Does it do this to all 23 tones? Repeters often take out tones that come in through the input freq. Or like I said, it might just be changing it just enough that your radio can't decode the tone. I think your best bet would be to find another repeater and try it on that, and maybe a few more if you are in an area where there are a lot of repeaters.

Best of luck

The reason for engraving a driver's license number is because that's the
one thing the police can trace. Social inSecurity Numbers or amateur
calls are not of much use to the police. Of course, if another amateur
buys the thing, and wants to check its ownership, engraving the call
would work.

Subject: ICOM Z1A

elekesa@cadvision.com (elekesa) wrote:

>Would anyone know of any mods for the IC-Z1A HT?

> Thanks
Here's a repost of the Z1A mods:

Ok, after messing around with the radio on my own and then getting the
"official" mod, here's a summary of the various diode mods for the Z1A:

Icom Z1A mods

[B]+[#]+[POWER] = Extended Receive.
VFO *DISPLAYS* 50-299.900 and 300-999.900.
AM Aircraft band enabled.
SET mode now has a new "PLACE" function for setting
the direct entry starting digit.

There is room for four diodes in the Z1A located on the CPU board to the left of the ribbon cable connector. On a US version, only the bottom two are installed. D15 is just below and to the right of the four diodes. These diodes are bigger than the rest of the surface mounted components and are easy to spot.
The official ICOM mod (which I unofficially saw...) is to remove D15 for extended TX and to use the above keyboard mod for extended receive. According to the sheet, the 800-900 band is NOT available in US versions.

```
+-+ +-+
| | | | <---- Installing diodes in either of these seems to do
+-+ +-+ nothing.
```

```
+-+ +-+
| | | | <---- IN: US Version 144-148 TX 440-450 TX
+-+ +-+ OUT: Extended 136-174 TX 380-470 TX (Lose auto-repeater
^ and tone encode)
|
+------------ IN: US 144-148 TX 440-450 TX
OUT: European 144-148 TX 430-440 TX
```

```
+-+
"D15"--> | | <---- IN: US Version Stock
+-+ OUT: Extended TX 136-174 380-470 (keeps auto-repeater
and tone encode)
```

A word of warning about messing with the four diode pads: If you detach either one of the installed diodes, the CPU will reset and you'll lose ALL of your memories. (found that out the hard way...) D15 doesn't seem to affect the memories at all.

Since the 800MHz band is not available in US versions, my guess is that there's a keyboard mod to unlock it instead of a diode. The diodes only seem to control the country versions. If anyone has any more keyboard mods, please post them.

Programable as well. Generally 5 watts for VHF or 4 watts for UHF.

>3) can you modify it for more channels?

Yes, but I don't think Motorola likes people doing it.

>4) In a related subject, I understand the HT-600/Radius 200 radios
>can be easily modified for 6 channel operation. How do you remove the knobs
>or escutcheon to gain access to the pin you need so the channel switch can
rotate to the

>other positions?

You grab the knobs and pull them off. They are friction fit. Some
are very strong. To remove the panel, you just lift it with a screw
driver or knife. It is glued on. If you are careful and don't crease
it, you can then just lay it back down and it will stick.

Paul,

I have run a CSI model CS-900 connected to a Alinco DR-590 on the VHF side for about a year and am very happy with it. (I call it my poor-man cellar) I keep the radio on a simplex freq. with tone Sql. on so others that may use the same freq. don't come into the house.
It is not quite a slick as a repeater autopatch but when the person on the phone understands the "you talk - then I talk" protocal it works fine. This setup can be run through a repeater that passes DTMF tones (not many do) or you can set up a call for someone on a repeater through your radio.
I connected the audio from the speaker jack to the CS-900 through a relay to an external speaker, and a 8-pin mic cable to a breakout box and run audio and PTT in parallel with the reg. mic. I use the radio as a base station with no problems and when I'm done just push the call button to get back on the simplex freq. The CS-900 has a 99 no. speed dial and has toll restrictions and can ring out on the air with your call or Tel. tone. I have set it up where I can call into the house and access the radio to call my wife while she's in the car.

I think I paid new $329.00 for the unit and for our needs it works fine. I work 3 miles from home and with 3 kids and all the ballparks and stuff we do around the neighborhood it is a good alt. to a real phone.

Sounds to me like a combination of several conditions. Normal repeater audio processing will roll-off the low frequencies unless they've specifically been tweaked to pass PL tones. I've had good luck passing tones above 150 Hz through most repeaters, so if Test A worked and Test B did not, check to see what tones were being used.

Also, Kenwood radios are known for having extra-hot PL injection (and no way to adjust it, unfortunately), so if the "it worked" test involved a Kenwood rig on the other end, that could be an explanation, as well.

Drew might want to try tones at the higher frequencies and see if they work with the Yaesu radios.

>works on simplex and not on the repeater might prove that. Ask around to see
>if there is a repeater in your area that will pass the tones.
>73 Ed

I was going to respond with a similar comment. However, after reading
his post several times, it became a real mystery. Remember (and you
apparently missed this), he was able to have someone else (besides his
wife) trigger his receiver VIA THE REPEATER, and he was able to
trigger the other person's receiver. I had originally thought that
since most repeaters either purposely don't pass pl, or just pass it
so poorly that it won't work, maybe the other person's pl was very hot
and forced its way through. However, that is negated by the fact that
HE was able to use HIS ht to trigger the other one. The only one that
doesn't seem to work is the path between him and his wife, either
direction.

I'm curious to see what the outcome of this is :)

There is an article by Ken Stuart (W3VVN) (ARRL Technical Advisor)
titled "Getting the Most Out of Nickel-Cadmium Batteries" that advises
never to completly run down (discharge) a NiCad battery. The article
also says that "memory" is of no real concern to the everyday HAM
user, as there are very specific conditions where memory would ever
becoome a problem.

The article lists and discusses several "myths" about NiCad batteries
and gives some good advice on how to treat, use, and charge your
batteries.

I saw the article in the "New HAM Companion" put out by ARRL.

Source record: 213608

I am looking to buy an AM or FM (pref FM) transmitter for my High School radio station which has up to now been closed circut. I live near NYC (approx 30 minutes away) and I'm looking for a range of 2-5 miles. I need info in terms of transmitter and antenna (suggestions of where to go). Also, what is the deal with licensing at this power (I have to tell the school board something because they are paying for it). Any help would be greatly appreciated.

Please respond via E-Mail
Thanx again
-Mike

DeWayne wanted to know if the Yaesu 840 has RF gain control. No
it doesn't...although I personally haven't missed it. It does have an
attenuator...

> Mark Saunders, tracker@indirect.com, wrote that he would like
> to hear from user of either radio with there views.

Mark,
I own a TS-850. This is my second 850 as I sold my first before leaving South America. I bought the second 850 because I was so pleased with the first one.

My favorite features are scratch memories and tunable memories. Also the fact that the last frequency is retained when jumping from band to band. There are the 100 memories but I do not use more than a dozen. Maybe one day I will find a use for more.

I will tell you that I have had some problems with the second rig. After about a year of higher band HFing, I began to work on 40 and 75. The tuner in the 40 meter section overheated and was unstable. I sent it back to Kenwood under warranty. The sent it back quickly but within 3 months the problem returned. This time, when I sent it back, althought for the same reason as before, they treated it as out of warranty repair and charged me. I felt that it was rip off but had little option. I do not want a 3rd party involoved just in case they still have not fixed the problem.

I know little of the 990. I have given my blessing on the 850 to others purchased the first because of the advice of others. I hope you receive enough info to help you make your descision.

What mods? There have been a couple of posts here recently looking
for mods on ther 2340H, but no responses. I've checked some of the
ftp mod sites and can't find anything either. What did you do, and
what did it get you? (I'd be happy just to open up the receiver to
wide band receive.)

This is Link Communications, Inc. In cooperation with Advanced
Computer Controls, Inc., we have purchased all rights to their past
and current controller software. We will soon be posting the EPROM
and EEPROM files on our FTP site (see info below) and hopefully
providing pre-programmed PROMS. In both cases, the software will be
the last FINISHED version, not Version 6 (which was never finished).
We will also be providing ACC's manuals for those that want them.

ACCESSING OUR MANUALS AND EPROM FILES BY ANONYMOUS FTP

If you are familiar with anonymous ftp, the site is
"ftp.netins.net" and our directory is "showcase/linkcomm". The
file "readme" contains a description of the files. If you are
not familiar with anonymous ftp, follow these directions:

1. Log on to your internet provider account.

2. Ftp to ftp.netins.net: "ftp ftp.netins.net".

3. When prompted for your logon, enter "anonymous".

4. Enter your email address as your password.

5. Change to our directory with the following commands:
"cd showcase"
"cd linkcomm"

6. Change the file transfer type to binary by typing "i".

7. Look at what files are in the directory: "ls -l".

8. Look at the readme file: "get readme -".

9. Change directories if needed: "cd RLC2".

10. Transfer the files you want to your account. Example:
"get rlc3v123.zip".

10. Exit ftp: "quit".

11. Download the files from your account to your pc as usual.

Try the one on ftp://ftp.ee.ualberta.ca/pub/cookbook/rf/. I can't
remember what the filename is, but they're only a few in that directory.
Other alternative is to buy one as advertised in the back of the
electronics magazines. Ramsey makes the FM-4, under $15.

greetings all!

i recently did the mods to my TH79A(D) following the mod in the oak.oakland
mod repository. All went well! i got the extended RX and TX ranges i wanted,
but now i can't get the 118-136 AM !!! :-(

So, does anybody know the UPDATED mod to a TH79A(D) as opposed to the
regular TH79A mod? The diodes in the "A" mod where in the same place on
my A(D) model, so i assumed there wasn't any hardware changes between them.

thanx for any info!

Jim Lowman (jlowman@netcom.com) wrote:
: As pointed out in e-mail, I have accidentally omitted Ten Tec as another rig
: under consideration. One of the OTs at the club has a lot good to say for
: them.

FACTS FROM A CW MAN>

IF YOU ARE A CW MAN THEN

1. The FT-1000 has very poor keying. Most of them have a slight chirp and
none of them have full-break in, QSK capable of the higher speeds.

2. Most Icom rigs sound very good on CW.

3. Ten-TEC's Omni 6 has very poor keying and it is widely known that the
QSK cannot keep up with high speed. Also, they drift considerably more
than any other modern day rig.

4. I have not heard much good on the Kenwood TS-950 series however, the
TS-850 has a wonderful reputation and works very well on CW. I think it
may be the top bargin on the market today. Probably it is less than half
the cost of the Icom and Yeasu top end rigs.

5. As far as service goes. Ten-Tec has the best but Ten-Tec needs it the
most. The Jap companies are in hot competition and service levels
probably vary considerably. I really got burned out on Yeasu once
so I won't go back even if they improve.

6. My rig is a 5 year old TS-940 and I love it. Those can be had now for
around $1500, a real bargin.

Subject: FT-840 vs IC-735

ANDRES MARTINEZ (amnet@ix.netcom.com) wrote:
: I'm undecided between buying a new Yaesu FT-840 and the ICOM IC-735
: which I can find used for about the same price ($800).

: They both have Gen.Cov. Receiver and dual VFO. I'm concern about
: reliability and signal clarity on the air.

: Which one do you think is a better choice ?

I would not vote in favor of the Icom 735. I had one for a couple of
years, and was *never* impressed with its receiver. The 735 design seemed
to incorporate a great deal of synthesizer noise, resulting in a poor
noise floor (making weak signal reception difficult) and what I perceived
as a poor dynamic range.

In addition, I came to hate the little slide pots under the front cover:
difficult and touchy to adjust.

Personally, I would recommend against the Icom 735 (and the Kenwood 140s
as well, for what it's worth).

Good luck!

>The transmitted audio on these radios (at least the three I've heard)
>has absolutely SUCKED. It is very bass sounding and muffled, bordering
>on distorted. I'm not impressed by this and wonder why a radio that
>costs as much as this sounds so cheap.

Yaesu has a mod to fix this. As with all new designs theres sometimes bugs
to work out. The audio seems to be echoing around inside the "pickel" making
it bassy. I sent mine in to Yaesu and they fixed it at no charge. On air
reports
say it's 100% better and sounds great.

With the new mike comming out for the 8500 there wont be this problem as it
is not as big and hollow as the "pickel". It's standard size.

Subject: Hull 5150 SSB transceiver

Hi.

I recently acquired on loan a Hull 5150 SSB Marine HF Transceiver.
Unfortunately it did not come with a manual.

It has an rs232 type connector at the back as well as an accessory sockets.
The front panel
contains a 16 key pad , a lcd frequency display, and a tuning and mode knobs.

I would like to know the protocol for the rs232 connector, and also how one
can control
the rf gain on both transmit and receive in this device.

I would very much appreciate hearing from anyone with experience or
information on the rig

Thanks

Subject: Icom 751a: opinions wanted

Peter A. Klein (pklein@news.seattleu.edu) wrote:

: Based on the above, I've thought about getting a used Icom 751a. However,
: after reading the ARRL Radio Buyer's Sourcebook (reprinted QST reviews)
: and talking to a few people (including ICOM service), I'm confused. I've
: been told that "the 751a was the best radio Icom ever made." I've also
: been told that the just-discontinued IC-735 receiver will outperform the
: 751a, that the 751a runs hot, and that the 751a has a similar front end to
: the 745 and may have similar overload problems.

Peter -

I can only coment on one aspect of your posting. I owned a 735 for a couple
of years, and have had the opportunity to operate a friend's recently
purchased 751a. There is simply *no way* that the 735's receiver is as
good as, or better than, the 751a's receiver.

When using the 735, I always thought it was a mediocre, noisy receiver -
I never missed the rig after I sold it. The 751a always seemed more
sensitive and less noisy; personally I'd buy one in a second *if* I could
afford it.

Good luck!

I didn't have an advert at hand when I first responded. Looking at a
current ICOM ad, they advertize their internet address as:

75540.525@compuserve.com

This address was sufficient for me to ask for and get the software mods
for my IC-W31A in June of this year. This beats a technical support hot
line hands down in my opinion.

Subject: Mods wonted for TW-4100

I just got a Kenwood TW-4100E and I am looking for the functions of the
diodes in the frontpanel. I found mods for TX/RX extention with the diodes
D6 (UHF) and D8 (VHF).
In my 4100E version are the D1, D2, D3, D4 and D5 already removed and
in the 4100A version are the D3, D4, D5 and D7 already removed.
So I am looking for functions of these diode if they are installed/removed.

Subject: Motorola radius question

Jeff,

Depending on the age, the P-110 MIGHT go more channels. Some do, some don't. They made a 2 watt and a 4 or 5 watt depending on VHF or UHF. ALL RADIUS products except P-10, SP-10, P-50 are programmable

Subject: need manual for JR500S

Just got a JR500S ham band only receiver at ham fest. It is a tube type receiver perhaps made in the 60's. Seems to work well,needs alignment,considering it looks like it had been stored in a damp basement. I need a schematic and maybe specs on it. Can anyone help me out? Hope to use it with a simple cw transmitter to help some young novice operators (tech +) get started doing something other than using their HT's.

Subject: TSQ on 51r will not work thru a repeater???

I am trying to get my parents to get their ham license. One of them is
going to take the test today. I am also planning on taking both of their
VISA cards shopping for two new FT-51Rs. Just out of curiosity, have you
tried using the CTCSS on more than one repeater? If I were to look at
this through the eyes of a troubleshooter, I would say that the repeater
might be doing something to your tone as it passes through. The fact that
the other guy you talked to recieved your tone may mean that the bandwith
of his CTCSS recieve unit might be larger than those found on the Yaesu.
Does it do this to all 23 tones? Repeters often take out tones that come
in through the input freq. Or like I said, it might just be changing it
just enough that your radio can't decode the tone. I think your best bet
would be to find another repeater and try it on that, and maybe a few more

if you are in an area where there are a lot of repeaters.

Best of luck

Max

The reason for engraving a driver's license number is because that's the
one thing the police can trace. Social inSecurity Numbers or amateur
calls are not of much use to the police. Of course, if another amateur
buys the thing, and wants to check its ownership, engraving the call
would work.

From: baptpdc@netcom.com (Bruce A. Pope)
Subject: ICOM Z1A

elekesa@cadvision.com (elekesa) wrote:

>Would anyone know of any mods for the IC-Z1A HT?

> Thanks
Here's a repost of the Z1A mods:

Ok, after messing around with the radio on my own and then getting the
"official" mod, here's a summary of the various diode mods for the Z1A:

Icom Z1A mods

[B]+[#]+[POWER] = Extended Receive.
VFO *DISPLAYS* 50-299.900 and 300-999.900.
AM Aircraft band enabled.
SET mode now has a new "PLACE" function for setting
the direct entry starting digit.

There is room for four diodes in the Z1A located on the CPU board to the left of the ribbon cable connector. On a US version, only the bottom two are installed. D15 is just below and to the right of the four diodes. These diodes are bigger than the rest of the surface mounted components and are easy to spot.
The official ICOM mod (which I unofficially saw...) is to remove D15 for extended TX and to use the above keyboard mod for extended receive. According to the sheet, the 800-900 band is NOT available in US versions.

```
+-+ +-+
| | | | <---- Installing diodes in either of these seems to do
+-+ +-+ nothing.

+-+ +-+
| | | | <---- IN: US Version 144-148 TX 440-450 TX
+-+ +-+ OUT: Extended 136-174 TX 380-470 TX (Lose auto-repeater
^ and tone encode)
|
+------------ IN: US 144-148 TX 440-450 TX
OUT: European 144-148 TX 430-440 TX

+-+
"D15"--> | | <---- IN: US Version Stock
+-+ OUT: Extended TX 136-174 380-470 (keeps auto-repeater
and tone encode)
```

A word of warning about messing with the four diode pads: If you detach either one of the installed diodes, the CPU will reset and you'll lose ALL of your memories. (found that out the hard way...) D15 doesn't seem to affect the memories at all.

Since the 800MHz band is not available in US versions, my guess is that there's a keyboard mod to unlock it instead of a diode. The diodes only seem to control the country versions. If anyone has any more keyboard mods, please post them.

>1) It is programmable or XTAL

Programable with "RIB" box and cable and software.

>2) wattage,etc

Programable as well. Generally 5 watts for VHF or 4 watts for UHF.

>3) can you modify it for more channels?

Yes, but I don't think Motorola likes people doing it.

>4) In a related subject, I understand the HT-600/Radius 200 radios
>can be easily modified for 6 channel operation. How do you remove the knobs
>or escutcheon to gain access to the pin you need so the channel switch can rotate to the
>other positions?

You grab the knobs and pull them off. They are friction fit. Some
are very strong. To remove the panel, you just lift it with a screw
driver or knife. It is glued on. If you are careful and don't crease

it, you can then just lay it back down and it will stick.

Paul,

I have run a CSI model CS-900 connected to a Alinco DR-590 on the VHF
side for about a year and am very happy with it. (I call it my poor-man
cellar) I keep the radio on a simplex freq. with tone Sql. on so others
that may use the same freq. don't come into the house.
It is not quite a slick as a repeater autopatch but when the person
on the phone understands the "you talk - then I talk" protocal it works
fine. This setup can be run through a repeater that passes DTMF tones
(not many do) or you can set up a call for someone on a repeater through
your radio.
I connected the audio from the speaker jack to the CS-900 through a relay
to an external speaker, and a 8-pin mic cable to a breakout box and run
audio and PTT in parallel with the reg. mic. I use the radio as a base
station with no problems and when I'm done just push the call button to
get back on the simplex freq. The CS-900 has a 99 no. speed dial and has
toll restrictions and can ring out on the air with your call or Tel. tone.
I have set it up where I can call into the house and access the radio to
call my wife while she's in the car.

I think I paid new $329.00 for the unit and for our needs it works fine.
I work 3 miles from home and with 3 kids and all the ballparks and stuff
we do around the neighborhood it is a good alt. to a real phone.

Sounds to me like a combination of several conditions. Normal repeater audio processing will roll-off the low frequencies unless they've specifically been tweaked to pass PL tones. I've had good luck passing tones above 150 Hz through most repeaters, so if Test A worked and Test B did not, check to see what tones were being used.

Also, Kenwood radios are known for having extra-hot PL injection (and no way to adjust it, unfortunately), so if the "it worked" test involved a Kenwood rig on the other end, that could be an explanation, as well.

Drew might want to try tones at the higher frequencies and see if they work with the Yaesu radios.

>works on simplex and not on the repeater might prove that. Ask around to see
>if there is a repeater in your area that will pass the tones.
>73 Ed

I was going to respond with a similar comment. However, after reading
his post several times, it became a real mystery. Remember (and you
apparently missed this), he was able to have someone else (besides his
wife) trigger his receiver VIA THE REPEATER, and he was able to
trigger the other person's receiver. I had originally thought that
since most repeaters either purposely don't pass pl, or just pass it
so poorly that it won't work, maybe the other person's pl was very hot
and forced its way through. However, that is negated by the fact that
HE was able to use HIS ht to trigger the other one. The only one that
doesn't seem to work is the path between him and his wife, either
direction.

I'm curious to see what the outcome of this is :)

There is an article by Ken Stuart (W3VVN) (ARRL Technical Advisor)
titled "Getting the Most Out of Nickel-Cadmium Batteries" that advises
never to completly run down (discharge) a NiCad battery. The article
also says that "memory" is of no real concern to the everyday HAM
user, as there are very specific conditions where memory would ever
becoome a problem.

The article lists and discusses several "myths" about NiCad batteries
and gives some good advice on how to treat, use, and charge your
batteries.

I saw the article in the "New HAM Companion" put out by ARRL.

>I saw the article in the "New HAM Companion" put out by ARRL.
Perhaps I understated the matter. I certainly agree that running a nicad down to the absolute dead state is not a good idea. By the "completely" I used above, I meant the point at which the radio quits. If you use nicads until the device stops working and then trickle charge them at a rate of C/10 for 14 hours, you'll do very nicely and see a long service life. If you allow the batteries to overheat, whether using some commercial charger or a home-made device, your service life will be much reduced.

As to memory effects, again, I suppose I did understate matters. Memory effect in modern nicad batteries is indeed a very minor concern. Hardly worth the time to worry about it.

While I've been very poorly impressed with a number of ARRL publications for their failure to correct errors year after year, I've not seen the article mentioned and cannot comment on it.

Newsgroup: rec.radio.amateur.equipment
Date: 1995-08-18 00:00:00 UTC
From: smithson@rosharon.wireline.slb.com
Message-ID: <412opn$hp8@sndsu1.sedalia.sinet.slb.com>
Source record: 213631

I am considering buying a transverter to work 2m SSB. I've only seen one supplier and that's Down East Microwave. They offer a 144-28 Mhz version with 25 watts out. Has anyone used a transverter and if so, what were you're impressions? Sounds too good to be true. $400 versus $1600 for an all mode VHF rig.

What are the limitations of such a set up? Can you do FM or is the FM from an HF rig "different"?

I am planning to use it with a Kenwood TS-850 SAT. If you've used anything like this, I would appreciate your input.

Message-ID: <412ba7$p07@clyde.open.ac.uk>
Source record: 213635

Hi Peter, I had a 751a for several years. I used it mostly on CW and installed the optional 250Hz filter. Performance was excellent, I never had RX overload problems, even under contest conditions. My only critisism was the QSK. Using an external keyer the transmitted CW was clipped, many other rigs do the same. I compensated by increasing the mark/space on the keyer. I later changed to a TS940S which has much better QSK. I ran the two together for some months. The 751a was a bit more sensitive on the higher bands. The 940 has more flexible filtering, and mine has IRC filters which are excellent. However I doubt there's anything I could copy on the 940 that I couldn't equally well on the 751a.
The QSK problem may be relevant to your amtor activities, I didn't try it. Amtor works fine on the 940.

I found an ART-13 in (of all places), an antique store for $169. I don't recall them being more valuable than $75 or so but it's been a while since I felt like fiddling with one of those dinosaurs.

Exactly what do you need to get them on the air as AM transmitters. I recall the final (an 813) taking around 2500V and the filaments are wired for 24Vdc.

OK, here come the questions: What kind of mike do you need, carbon or dynamic? Do I need a control box if I'm going to manually tune the thing? What other voltages do I need? How's it work on CW?

I ran into someone who actually had put a couple of those things on the air and said that they have a very good modulator (and hence, good XMT audio). Anyone else out there use one recently?

Please e-mail to : geoffs@onr.com. Thanks!

As pointed out in e-mail, I have accidentally omitted Ten Tec as another rig under consideration. One of the OTs at the club has a lot good to say for them.

At this point, I'm still ruling out Kenwood, due to a lot of negative feedback about their rigs and service. And the 950 doesn't really interest me as much as the others.

All,

I am looking for the schematic of a Micor squelch circuit that uses the 7716 chip. I need to graft it into a GE Master II and I don't know which version of the Micor uses this chip, nor do I have a service manual to reference, if anyone has information that could help. please email or post a reply. If you want and have the information and it is faxable, please feel free to send to the number listed below.

Thanks,
Alan Adamson

I am pleased to announce a new product offered by Positive Time Systems called the RCS-I. This is a radio controller that connects to any VHF/UHF transceiver and can issue x-10 commands. (X-10 is a power line standard for controlling devices throughout a building. Sears, Radio Shack, and others offer these compatible units)
The unit also has an alarm input, a listen feature, a short voicmail box, and responds to all commands in a pleasant female voice. The system IDs with your recorded voice and call sign. This description doesn't do the product justice, so please check out the new homepage at :

http://www.halcyon.com/pos.time.sys/top

or you may email us with you address so that we can promptly send you our brochure and newsletter.

NOTE: This product is intended for US voltages of 120 / 220 VAC. Another version is offered to support other international power standards.

FLASH! NEW FEATURE! The RCS-I has a new feature called Secure Access Mode(SAM). When enabled, the access code changes dozens of times per hour, making it virtually impossible to hack into.

Thank You,

Marshall Craw <mcraw@halcyon.com>
Positive Time Systems

>Is anybody able to help me?

What do you mean, "is not clear"? Do you mean the frequency response is
not flat across the bandwidth of the filter in use, or do you mean that
the audio is distorted, or do you mean that the signal is weak and noisy,
etc? More information please. Detail the symptoms, and the conditions under
which they appear, and we'll try to help.

The reason for engraving a driver's license number is because that's the
one thing the police can trace. Social inSecurity Numbers or amateur
calls are not of much use to the police. Of course, if another amateur
buys the thing, and wants to check its ownership, engraving the call
would work.

You might hold off for awhile. Yaesu is bringing out the
FT-1000MP which has DSP on receive and some other improvements.
If you're going to spend the bucks, might as well wait for the
latest.

Subject: Icom IC-Delta1A triband Handheld info?

Just out of curiosity, where do you live? Here in Oregon, we only have
two 23cm repeaters. The Delta looks like a great radio, although it is
still kind of brickish. I own a Icom 2GAT, and I find it a little hard to
carry it around with me sometimes just because of it's size.

Subject: ICOM Z1A

elekesa@cadvision.com (elekesa) wrote:

>Would anyone know of any mods for the IC-Z1A HT?

> Thanks
Here's a repost of the Z1A mods:

Ok, after messing around with the radio on my own and then getting the
"official" mod, here's a summary of the various diode mods for the Z1A:

Icom Z1A mods

[B]+[#]+[POWER] = Extended Receive.
VFO *DISPLAYS* 50-299.900 and 300-999.900.
AM Aircraft band enabled.
SET mode now has a new "PLACE" function for setting
the direct entry starting digit.

There is room for four diodes in the Z1A located on the CPU board to the left of the ribbon cable connector. On a US version, only the bottom two are installed. D15 is just below and to the right of the four diodes. These diodes are bigger than the rest of the surface mounted components and are easy to spot.
The official ICOM mod (which I unofficially saw...) is to remove D15 for extended TX and to use the above keyboard mod for extended receive. According to the sheet, the 800-900 band is NOT available in US versions.

```
+-+ +-+
| | | | <---- Installing diodes in either of these seems to do
+-+ +-+ nothing.

+-+ +-+
| | | | <---- IN: US Version 144-148 TX 440-450 TX
+-+ +-+ OUT: Extended 136-174 TX 380-470 TX (Lose auto-repeater
^ and tone encode)
|
+------------ IN: US 144-148 TX 440-450 TX
OUT: European 144-148 TX 430-440 TX

+-+
"D15"--> | | <---- IN: US Version Stock
+-+ OUT: Extended TX 136-174 380-470 (keeps auto-repeater
and tone encode)
```

A word of warning about messing with the four diode pads: If you detach either one of the installed diodes, the CPU will reset and you'll lose ALL of your memories. (found that out the hard way...) D15 doesn't seem to affect the memories at all.

Since the 800MHz band is not available in US versions, my guess is that there's a keyboard mod to unlock it instead of a diode. The diodes only seem to control the country versions. If anyone has any more keyboard mods, please post them.

Programable with "RIB" box and cable and software.

>2) wattage,etc

Programable as well. Generally 5 watts for VHF or 4 watts for UHF.

>3) can you modify it for more channels?

Yes, but I don't think Motorola likes people doing it.

>4) In a related subject, I understand the HT-600/Radius 200 radios
>can be easily modified for 6 channel operation. How do you remove the knobs
>or escutcheon to gain access to the pin you need so the channel switch can rotate to the
>other positions?

You grab the knobs and pull them off. They are friction fit. Some
are very strong. To remove the panel, you just lift it with a screw
driver or knife. It is glued on. If you are careful and don't crease

it, you can then just lay it back down and it will stick.

Paul,

I have run a CSI model CS-900 connected to a Alinco DR-590 on the VHF
side for about a year and am very happy with it. (I call it my poor-man
cellar) I keep the radio on a simplex freq. with tone Sql. on so others
that may use the same freq. don't come into the house.
It is not quite a slick as a repeater autopatch but when the person
on the phone understands the "you talk - then I talk" protocal it works
fine. This setup can be run through a repeater that passes DTMF tones
(not many do) or you can set up a call for someone on a repeater through
your radio.
I connected the audio from the speaker jack to the CS-900 through a relay
to an external speaker, and a 8-pin mic cable to a breakout box and run
audio and PTT in parallel with the reg. mic. I use the radio as a base
station with no problems and when I'm done just push the call button to
get back on the simplex freq. The CS-900 has a 99 no. speed dial and has
toll restrictions and can ring out on the air with your call or Tel. tone.
I have set it up where I can call into the house and access the radio to
call my wife while she's in the car.

I think I paid new $329.00 for the unit and for our needs it works fine.
I work 3 miles from home and with 3 kids and all the ballparks and stuff
we do around the neighborhood it is a good alt. to a real phone.

Date: 16 Aug 1995 03:22:00 GMT
From: steinr@holmes.ece.orst.edu (Raymond Stein)
Subject: RC-1000 controller questions

I was planning on purchasing an RC-1000 repeater controller for use in a
GE Mastr II UHF application. Does anybody have any opinions on this
controller, good or bad? Or are there better controllers for the same
price?

Thanks for any help offered.

Sounds to me like a combination of several conditions. Normal repeater audio processing will roll-off the low frequencies unless they've specifically been tweaked to pass PL tones. I've had good luck passing tones above 150 Hz through most repeaters, so if Test A worked and Test B did not, check to see what tones were being used.

Also, Kenwood radios are known for having extra-hot PL injection (and no way to adjust it, unfortunately), so if the "it worked" test involved a Kenwood rig on the other end, that could be an explanation, as well.

Drew might want to try tones at the higher frequencies and see if they work with the Yaesu radios.

>73 Ed

I was going to respond with a similar comment. However, after reading
his post several times, it became a real mystery. Remember (and you
apparently missed this), he was able to have someone else (besides his
wife) trigger his receiver VIA THE REPEATER, and he was able to
trigger the other person's receiver. I had originally thought that
since most repeaters either purposely don't pass pl, or just pass it
so poorly that it won't work, maybe the other person's pl was very hot
and forced its way through. However, that is negated by the fact that
HE was able to use HIS ht to trigger the other one. The only one that
doesn't seem to work is the path between him and his wife, either
direction.

I'm curious to see what the outcome of this is :)

There is an article by Ken Stuart (W3VVN) (ARRL Technical Advisor)
titled "Getting the Most Out of Nickel-Cadmium Batteries" that advises
never to completly run down (discharge) a NiCad battery. The article
also says that "memory" is of no real concern to the everyday HAM
user, as there are very specific conditions where memory would ever
becoome a problem.

The article lists and discusses several "myths" about NiCad batteries
and gives some good advice on how to treat, use, and charge your
batteries.

I saw the article in the "New HAM Companion" put out by ARRL.

The reason for engraving a driver's license number is because that's the
one thing the police can trace. Social inSecurity Numbers or amateur
calls are not of much use to the police. Of course, if another amateur
buys the thing, and wants to check its ownership, engraving the call
would work.

Subject: ICOM Z1A

elekesa@cadvision.com (elekesa) wrote:

>Would anyone know of any mods for the IC-Z1A HT?

> Thanks
Here's a repost of the Z1A mods:

Ok, after messing around with the radio on my own and then getting the
"official" mod, here's a summary of the various diode mods for the Z1A:

Icom Z1A mods

[B]+[#]+[POWER] = Extended Receive.
VFO *DISPLAYS* 50-299.900 and 300-999.900.
AM Aircraft band enabled.
SET mode now has a new "PLACE" function for setting
the direct entry starting digit.

There is room for four diodes in the Z1A located on the CPU board to the left
of the ribbon cable connector. On a US version, only the bottom two are
installed. D15 is just below and to the right of the four diodes. These
diodes are bigger than the rest of the surface mounted components and are easy
to spot.
The official ICOM mod (which I unofficially saw...) is to remove D15 for
extended TX and to use the above keyboard mod for extended receive. According
to the sheet, the 800-900 band is NOT available in US versions.

```
+-+ +-+
| | | | <---- Installing diodes in either of these seems to do
+-+ +-+ nothing.
```

```
+-+ +-+
| | | | <---- IN: US Version 144-148 TX 440-450 TX
+-+ +-+ OUT: Extended 136-174 TX 380-470 TX (Lose auto-repeater
^ and tone encode)
|
+------------ IN: US 144-148 TX 440-450 TX
OUT: European 144-148 TX 430-440 TX
```

```
+-+
"D15"--> | | <---- IN: US Version Stock
+-+ OUT: Extended TX 136-174 380-470 (keeps auto-repeater
and tone encode)
```

A word of warning about messing with the four diode pads: If you detach
either one of the installed diodes, the CPU will reset and you'll lose ALL of
your memories. (found that out the hard way...) D15 doesn't seem to affect
the memories at all.

Since the 800MHz band is not available in US versions, my guess is that
there's a keyboard mod to unlock it instead of a diode. The diodes only seem
to control the country versions. If anyone has any more keyboard mods, please
post them.

You grab the knobs and pull them off. They are friction fit. Some
are very strong. To remove the panel, you just lift it with a screw
driver or knife. It is glued on. If you are careful and don't crease
it, you can then just lay it back down and it will stick.

Paul,

I have run a CSI model CS-900 connected to a Alinco DR-590 on the VHF side for about a year and am very happy with it. (I call it my poor-man cellar) I keep the radio on a simplex freq. with tone Sql. on so others that may use the same freq. don't come into the house.
It is not quite a slick as a repeater autopatch but when the person on the phone understands the "you talk - then I talk" protocal it works fine. This setup can be run through a repeater that passes DTMF tones (not many do) or you can set up a call for someone on a repeater through your radio.
I connected the audio from the speaker jack to the CS-900 through a relay to an external speaker, and a 8-pin mic cable to a breakout box and run audio and PTT in parallel with the reg. mic. I use the radio as a base station with no problems and when I'm done just push the call button to get back on the simplex freq. The CS-900 has a 99 no. speed dial and has toll restrictions and can ring out on the air with your call or Tel. tone. I have set it up where I can call into the house and access the radio to call my wife while she's in the car.

I think I paid new $329.00 for the unit and for our needs it works fine.
I work 3 miles from home and with 3 kids and all the ballparks and stuff
we do around the neighborhood it is a good alt. to a real phone.

Sounds to me like a combination of several conditions. Normal repeater
audio processing will roll-off the low frequencies unless they've
specifically been tweaked to pass PL tones. I've had good luck passing
tones above 150 Hz through most repeaters, so if Test A worked and Test B
did not, check to see what tones were being used.

Also, Kenwood radios are known for having extra-hot PL injection (and no
way to adjust it, unfortunately), so if the "it worked" test involved a
Kenwood rig on the other end, that could be an explanation, as well.

Drew might want to try tones at the higher frequencies and see if they
work with the Yaesu radios.

I was going to respond with a similar comment. However, after reading
his post several times, it became a real mystery. Remember (and you
apparently missed this), he was able to have someone else (besides his
wife) trigger his receiver VIA THE REPEATER, and he was able to
trigger the other person's receiver. I had originally thought that
since most repeaters either purposely don't pass pl, or just pass it
so poorly that it won't work, maybe the other person's pl was very hot
and forced its way through. However, that is negated by the fact that
HE was able to use HIS ht to trigger the other one. The only one that
doesn't seem to work is the path between him and his wife, either
direction.

I'm curious to see what the outcome of this is :)

There is an article by Ken Stuart (W3VVN) (ARRL Technical Advisor)
titled "Getting the Most Out of Nickel-Cadmium Batteries" that advises
never to completly run down (discharge) a NiCad battery. The article
also says that "memory" is of no real concern to the everyday HAM
user, as there are very specific conditions where memory would ever
becoome a problem.

The article lists and discusses several "myths" about NiCad batteries
and gives some good advice on how to treat, use, and charge your
batteries.

I saw the article in the "New HAM Companion" put out by ARRL.

The reason for engraving a driver's license number is because that's the
one thing the police can trace. Social inSecurity Numbers or amateur
calls are not of much use to the police. Of course, if another amateur
buys the thing, and wants to check its ownership, engraving the call
would work.

Subject: ICOM Z1A

elekesa@cadvision.com (elekesa) wrote:

>Would anyone know of any mods for the IC-Z1A HT?

> Thanks
Here's a repost of the Z1A mods:

Ok, after messing around with the radio on my own and then getting the
"official" mod, here's a summary of the various diode mods for the Z1A:

Icom Z1A mods

[B]+[#]+[POWER] = Extended Receive.
VFO *DISPLAYS* 50-299.900 and 300-999.900.
AM Aircraft band enabled.
SET mode now has a new "PLACE" function for setting
the direct entry starting digit.

There is room for four diodes in the Z1A located on the CPU board to the left
of the ribbon cable connector. On a US version, only the bottom two are
installed. D15 is just below and to the right of the four diodes. These
diodes are bigger than the rest of the surface mounted components and are easy
to spot.
The official ICOM mod (which I unofficially saw...) is to remove D15 for
extended TX and to use the above keyboard mod for extended receive. According
to the sheet, the 800-900 band is NOT available in US versions.

```
+-+ +-+
| | | | <---- Installing diodes in either of these seems to do
+-+ +-+ nothing.
```

```
+-+ +-+
| | | | <---- IN: US Version 144-148 TX 440-450 TX
+-+ +-+ OUT: Extended 136-174 TX 380-470 TX (Lose auto-repeater
^ and tone encode)
|
+------------ IN: US 144-148 TX 440-450 TX
OUT: European 144-148 TX 430-440 TX
```

```
+-+
"D15"--> | | <---- IN: US Version Stock
+-+ OUT: Extended TX 136-174 380-470 (keeps auto-repeater
and tone encode)
```

A word of warning about messing with the four diode pads: If you detach
either one of the installed diodes, the CPU will reset and you'll lose ALL of
your memories. (found that out the hard way...) D15 doesn't seem to affect
the memories at all.

Since the 800MHz band is not available in US versions, my guess is that
there's a keyboard mod to unlock it instead of a diode. The diodes only seem
to control the country versions. If anyone has any more keyboard mods, please
post them.

>2) wattage,etc

Programable as well. Generally 5 watts for VHF or 4 watts for UHF.

>3) can you modify it for more channels?

Yes, but I don't think Motorola likes people doing it.

>4) In a related subject, I understand the HT-600/Radius 200 radios
>can be easily modified for 6 channel operation. How do you remove the knobs
>or escutcheon to gain access to the pin you need so the channel switch can
rotate to the
>other positions?

You grab the knobs and pull them off. They are friction fit. Some
are very strong. To remove the panel, you just lift it with a screw
driver or knife. It is glued on. If you are careful and don't crease
it, you can then just lay it back down and it will stick.

Paul,

I have run a CSI model CS-900 connected to a Alinco DR-590 on the VHF side for about a year and am very happy with it. (I call it my poor-man cellar) I keep the radio on a simplex freq. with tone Sql. on so others that may use the same freq. don't come into the house.
It is not quite a slick as a repeater autopatch but when the person on the phone understands the "you talk - then I talk" protocal it works fine. This setup can be run through a repeater that passes DTMF tones (not many do) or you can set up a call for someone on a repeater through your radio.
I connected the audio from the speaker jack to the CS-900 through a relay to an external speaker, and a 8-pin mic cable to a breakout box and run audio and PTT in parallel with the reg. mic. I use the radio as a base station with no problems and when I'm done just push the call button to get back on the simplex freq. The CS-900 has a 99 no. speed dial and has toll restrictions and can ring out on the air with your call or Tel. tone. I have set it up where I can call into the house and access the radio to call my wife while she's in the car.

I think I paid new $329.00 for the unit and for our needs it works fine.
I work 3 miles from home and with 3 kids and all the ballparks and stuff
we do around the neighborhood it is a good alt. to a real phone.

Sounds to me like a combination of several conditions. Normal repeater
audio processing will roll-off the low frequencies unless they've
specifically been tweaked to pass PL tones. I've had good luck passing
tones above 150 Hz through most repeaters, so if Test A worked and Test B
did not, check to see what tones were being used.

Also, Kenwood radios are known for having extra-hot PL injection (and no
way to adjust it, unfortunately), so if the "it worked" test involved a
Kenwood rig on the other end, that could be an explanation, as well.

Drew might want to try tones at the higher frequencies and see if they
work with the Yaesu radios.

>73 Ed

I was going to respond with a similar comment. However, after reading
his post several times, it became a real mystery. Remember (and you
apparently missed this), he was able to have someone else (besides his
wife) trigger his receiver VIA THE REPEATER, and he was able to
trigger the other person's receiver. I had originally thought that
since most repeaters either purposely don't pass pl, or just pass it
so poorly that it won't work, maybe the other person's pl was very hot
and forced its way through. However, that is negated by the fact that
HE was able to use HIS ht to trigger the other one. The only one that
doesn't seem to work is the path between him and his wife, either
direction.

I'm curious to see what the outcome of this is :)

There is an article by Ken Stuart (W3VVN) (ARRL Technical Advisor)
titled "Getting the Most Out of Nickel-Cadmium Batteries" that advises
never to completly run down (discharge) a NiCad battery. The article
also says that "memory" is of no real concern to the everyday HAM
user, as there are very specific conditions where memory would ever
becoome a problem.

The article lists and discusses several "myths" about NiCad batteries
and gives some good advice on how to treat, use, and charge your
batteries.

I saw the article in the "New HAM Companion" put out by ARRL.

Hello to one and all.

This is my first posting to this list and I am also new to the net, so please excuse any errors in Netiquette.

My Icom R-7000 has a problem staying on frequency. I have had it on the bench several times but the problem keeps coming back.

The radio will be fine for a while and then jump about 11 kc of freq in the opposite direction of the last time it did it.

Anybody ever see anything remotely like this?

Thanks and 73s

Darrell

Transverters work great!

No problem with the FM from a normal(?) HF rig, as long as it transmits NBFM (normal). The only problem you may have on FM is if the transverter does not have the proper offset (or the HF rig dosn't have dual VFOs) you may not be able to use repeaters.

I use transverters on 6M, 2M, 70cm, and 1296. I also have dedicated all mode rigs on 6M and 2M and find that the transverters are just as good as the all modes.

Good luck and 73s

I am buying a 2 meter HT. The ALINCO Dj-180 T. I have a few questions maybe someone can answer about antennas. First, I am cheap. Suggestions for antennas would be better if under $75. I don't want a beam because I would have to get a rotator. (Repeaters in my area are at least 10 miles away and in opposite directions.) I am thinking about buying the discone antenna at radio shack so if I buy a scanner, I've already got an antennaa. I also like the Iso Pole antenna. Tell me what you think. I will be very grateful. Thanks for all your help.

I've seen ads for what appears to be a 6-inch length of wire that mounts at the base of a 2-meter handheld ducky. It is supposed to give you a ground plane and thereby extend your reach dramatically. It sells for something like seven bucks. Three questions:

1. Does it work?

2. Why doesn't everybody use one?

3. Couldn't you wrap one end of a piece of scrap wire around the base of your HT and save the seven bucks?

Thanks! ---Dan

>
>1. Does it work?

Yes. It supplies the monopole with a counterpoise. Normally, your
body supplies the counterpoise, but you aren't very conductive to
RF.

>2. Why doesn't everybody use one?

It looks stupid. :-)

>3. Couldn't you wrap one end of a piece of scrap wire around the base of
>your HT and save the seven bucks?

Sort of. What you actually want is a *19* inch wire that connects
to the shell of the BNC antenna connector. The Tiger Tail has an
alligator clip, but a ring terminal you can wedge between the
antenna BNC shell and the radio connector would be better because
it won't pop off unexpectedly and be lost.

The Tiger Tail is a ripoff from strictly an economic view, or a
great marketing gimmick from another point of view. The idea
is sound, however, and you can make the equivalent for about
15 cents.

Hello,

I have recently acquired an Icom IC2SA 2 meter rig without a manual. Icom (UK) seem to have ignored my requests for help and a manual so does anyone out there have a manual I could photocopy or purchase?
I know there are many mods meant to be in existence for this rig. Anyone have any details of these? Most of all, I want to be able to fit a 1750Hz toneburst as my set doesn't have one being a US model.
Please email any replies to al@boltons.demon.co.uk.

Many thanks!

Al Bolton.

>looks very nice, but gotta have RF gain. 73
> DeWayne AA9AF

Doesn't have it... Probably the biggest flaw in an otherwise excellent
rig. Also doesn't have VOX, but I don't miss that, especially mobile.
What I do like: it's smaller than the IC-735, probably has a better
receiver. Nice audio, now that I replaced the hand mike element with
a Heil HC-5; still have freq up down control from the mike = works nice.
I could have gotten an IC-735 used for about 700, but the 840 was only
800 new, with warranty. No brainer, really.

In article <199508151421.HAA03635@UCSD.EDU>, M740166%SLVMA.PRofs@mdcgwy.mdc.COM says:

snip

They're both fine radios. I've used the 990 at a friends house, also
used an FT1000 during field day. I own the 850, though, and would not
trade it even for the more expensive 990. Here are few reasons.
The 850's flexibility in receive (and transmit) filter selection allows
me to select whatever if bandwidth fits the situation - sometimes I open
up the AM to 12khz - unbelievably good audio for shortwave listening.
The 850 has no built in power supply, so its more portable.
I like the LED readout for multimter; the 990 uses old fashioned needle.
(the 850's meter can be set for peak hold which is really nice)
Passband tuning in the 850 really works well on adjacent channel interf.
850 can easily be turned up to 150 Watts; don't know about the 990. I've
been running mine at 150 for years, no problems.
The 990 may have a better receiver, but there's not a big difference.
All in all, the 850 has more features for less price.
You may want to stay tuned for new radios being released by all majors;
looks like they're coming out with new rigs in the 850/990 price range

Message-ID: <Pine.BSD/.3.91.950819121131.17014D-100000@ecf2.puc.edu>
Source record: 213651

I just recently got ahold of the Mods for the TH-79A. I own the TH-79A(D).

I thought that the MODS would be the same for both models but when I completed the "extended receive" mod I ran into trouble.

Like a message that was posted by someone else I lost my AM receive from 118-136 I believe. But ALSO I lost control of part of my keypad. From 3 down the row to the #. I am just wondering if there are any different mods between the 79a and the 79ad. And if anyone knows why I would have lost control of my keypad, or if anyone has had the same trouble?

Thank You

Matt Mills

Add a Plectron or Motorola Alert
Crystal Controlled Monitor Receiver
to Your Scanner Collection

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author.]

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their transistor Plectron and Motorola monitor receivers. They have now been replaced by portable pagers, and are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel programmable scanner. They can be powered from 117VAC or 12VDC with the proper mobile cord. The audio | quality of a Plectron P1, Plectron 700 series, and Motorola Alert Monitor is far better than any consumer grade scanner and the sensitivity, image rejection, and intermod immunity is outstanding when aligned properly. *

The Plectron and Motorola Alert monitors are single band | receivers: VHF-low, VHF-high, or UHF. No single Plectron | or Motorola Alert monitor can cover the entire 30-50 MHz | band, so there were versions optimized for each portion of | the VHF-low band. There were different versions to cover | low and high "splits" in the VHF-high band, too. Although | UHF versions were made, they are somewhat rare and coverage | is limited to 470 MHz and below. |

Plectron made several models with dozens of different | options. Both the original P1 and later 700 series are | suitable for restoration, although I prefer the newer 700 | models. The Plectron 500 "economy" series is less | desirable. |

The P1 series have black cabinets with a blue-green and |
silver color scheme used on the front panel. They were |
made in the Chief (tone decoder & carrier squelch), Patrol |
(carrier squelch only), and Sentry (tone only) models. The |
Sentry models lack a carrier squelch and therefore are of |
little use to hobbyists except for scavenging parts. Model |
number and frequency information appears on a gummed label |
on the rear panel: |

Band (MHz) Chief Patrol |
_____ |
25-54 R19 R15 |
148-174 R20 R16 |
450-470 R23 R21 |

Table 1. Plectron P1 models |

The R700 series have black cabinets with brown front panels |
and are slightly smaller than the P1 receivers. R700s were |
made in the Chief (tone decoder & carrier squelch) and |
Patrol (carrier squelch only) models: |

Band (MHz) Chief Patrol |
_____ |
25-54 R719 R715 |
148-174 R720 R716 |
450-470 R723 R721 |

Table 2. Plectron 700 models |

The Plectron FM Receiver/Recorder is a collector's item. |
It is essentially a 700 series Chief receiver with a built |
in cassette tape recorder. The recorder is carrier |
activated and can tape transmissions while the receiver is |
unattended. A connector on the rear panel allows for all |
kinds of remote control possibilities. |

I use two Plectron P1s and four R700s in my living room, |
seven R700s down the basement, and several Plectrons and
Alert Monitors stored in reserve. The basement Plectrons
are turned on automatically when someone walks down
downstairs. Power to them is controlled by a modified |
Radio Shack Safe House infrared motion detector, originally
sold as an intrusion alarm.

When a rescue squad member from Missouri advertised a
number of Plectrons on USENET, I bought them -- all 20+ of
them. I cleaned, fixed, and restored each one. After |
recrystalling them on local frequencies, I distributed them |
to members of my scanner club who were glad to get them.

Both brands of receiver require special crystals. I *
sometimes use Radio Shack's generic 3rd overtone scanner
crystals in the Plectrons but they oscillate on frequencies

far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency.

AC power cords for both types of receivers use unique connectors and are scarce. You can buy them new but it's much cheaper to drill a hole on the rear panel and attach a permanent a power cord. Make sure you use a grommet in the hole to prevent the metal chassis from chafing the line cord.

Many Plectrons and Alert Monitors were equipped with an internal NiCd battery pack, intended to power the receiver if the AC power fails. It's unusual to find a used monitor receiver with the NiCd pack still capable of holding a charge. More often, the batteries have died and the series charging resistor has overheated and burned. Be sure to remove the dead batteries as they often leak.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

I have not used the Plectron tone alerting features so I cannot address that except to say that the special coils and capacitors for the dual tone decoders vary depending on the tone frequencies and are somewhat difficult to obtain. Plectron receiver repair service is offered by:

Woodson Electronics/Plectron
Plectron Place
P.O. Box 960
Imboden, Arkansas 72434

telephone 1-(501)869-7985

Some replacement parts are currently available from Federal Signal in University Park, IL, phone (800)524-3021. | Woodson is negotiating with Federal Signal to be able to sell replacement parts for older Plectron receivers.

Alert Monitor parts are available from Motorola. Phone (800)972-3226.

I currently have no Plectrons or Motorola Alert Monitors for sale. I'm hoarding them. :-)

I have a new 1995 Dodge Caravan (minivan) with fuel injection and cruise control but not the notorious ABS brakes.

Are there any special problems I should watch out for when installing a 40-watt 2-meter transmitter in this car? Has anyone experienced RFI to the engine control circuits?

Also, is there a switched 12-volt line under the hood? I can only find unswitched ones. I want to wire the radio directly to the battery through a relay which will be controlled by a switched 12-volt line.

Hello,

I will soon move from UK to South America (Guyana) and want to purchase
a reasonable quality SW receiver to listen in to BBC World Service and
similar stations. While I am fairly technically minded, I am a bit put off by
the blizzard of 'bells and whistles' on a lot of the kit out there. So I humbly
ask r.r.a.e regulars to let me have some advice. I plan to spend about 100
UK pounds. Can you suggest a reasonable machine to buy or can you let
me know what to look for/to avoid when purchasing a receiver.

My thanks in advance for any replies.

Look at the Sony 7600G (notice the 'g'). It has all the bells and whistles you need. A good reciever, direct entry, portable, can use either built in or external antenna, and it's in your price range.

I have the DEM 144 MHz to 28 MHz transverter that you asked about.
I built it about 8 months ago. It has worked perfectly. I like it
due to the use of bandpass filters that really helps cut down on
the intermod. You can customize it when you build it by leaving out
one of the amplifier stages in the 144 MHz section if you use an
external preamp so you won't overdrive the transverter input. You
can also do the same with the 28 MHz transmit input.

> What are the limitations of such a set up? Can you do FM or is the FM
> from an HF rig "different"?

The transverter is a linear device and as such will work with
any mode your HF rig is capable of. I have used mine to check into
a local 2 Meter FM net on 145.440 MHz. Be warned howerver that the
transverter only works up to 145.999 MHz so will not work for
repeaters above 145.999 MHz. I have used mine on a local repeater
in the lower sub band. Mostly I use it for weak signal stuff at the
very bottom of the 2M band.

> I am planning to use it with a Kenwood TS-850 SAT. If you've used
> anything like this, I would appreciate your input.

I use mine with the TS-850 and it works well. If you have any
questions about hooking up a transverter to the 850 drop me an
e-mail.

Cheers, Terry KJ7F

Bob,

All this does is change the display frequency to the 50, 144
430 MHz. The radio still works on the original frequencies.
To my knowledge Kenwood does not make a transverter. If you
are interested you might look into the line of transverters by
Down East Microwave. In addition to the transverter an minor
wiring change is required inside the radio for it to work with
a transverter, that change is outlined in the owners manual.

Several years ago I broke the 10-meter VCO adustment cap on my 210M. I wrote a note to the 'new' Atlas Radio company asking if they could recommend a replacement part. They sent me a replacement piston cap at no charge. A year or so later I had them do some work on the radio (AGC didn't work below freezing). They completed the repairs quickly, and at a reasonable cost.

Source record: 213504

Steve Ellington (n4lq@iglou.iglou.com) wrote:

: 2. Most Icom rigs sound very good on CW.

I'll agree. One quirk on transmit, is that they do shorten dots a bit, and that the effect is different on full-QSK and "VOX" operation. The built in keyer in my 765 has a weighting control which can fix this, but you need to either listen off air or use a 'scope off air to set it up properly - don't listen to the sidetoneto do this :-)

On receive, ICOM are most impressive, they go for artfully shaped filters with low ringing, rather than for the specmanship of filters that look super-rectangular in brochures. The 765 has a good clear sound, and it's good to leave it on a wide bandwidth and keep an ear on a few signals without suffering bad audio.

: 4. I have not heard much good on the Kenwood TS-950 series however, the
: TS-850 has a wonderful reputation and works very well on CW. I think it
: may be the top bargin on the market today. Probably it is less than half
: the cost of the Icom and Yeasu top end rigs.

I'd agree about the 950 series, though I'm unsure about the 850. I looked long and hard at the 850 and reckoned that a lot more work went into it's programmable features than into its fundamental radio aspects. I was staggered when I saw an 850 the first time, it was on a rally stall, no power available. Hordes were pressed around it, spinning knobs, pressing buttons on the unpowered rig. What exotica were their minds conjuring? Some of them were offering the trader cheques for over the list price to be able to take it away and have the first in the area! I didn't hear the voices of rare DX in my head, just P T Barnum...

: 5. As far as service goes. Ten-Tec has the best but Ten-Tec needs it the
: most. The Jap companies are in hot competition and service levels
: probably vary considerably. I really got burned out on Yeasu once
: so I won't go back even if they improve.

Understandable. But, then, any of them could have done the same. From reports on this net, I get the impression that service is a lottery, though Ten-Tec are outstanding.

: 6. My rig is a 5 year old TS-940 and I love it. Those can be had now for
: around $1500, a real bargin.

I think the 930 and 940 were their last worthwhile HF radios. The 940 has rather bad local oscillator phase noise. The UK importer developed a hardware mod that made a big improvement. I don't know the

details of it's implementation, but I gather that it was a case of poor choice of loop gain/timeconstants and some poor signal/ground routing.

DSP
****

The main DSP schemes in amateur radio are really just audio filters. Certainly fabulously good audio filters, but suffering the same problems of IF overload common to all superhet receivers relying on any audio selectivity narrower than their early IF filters (and that goes for notches, too)

DSP will really come into its own at IF. The professional receivers already on the market, and the amateur ones just coming out are a move in the right direction, but, as yet, there simply aren't any analogue to digital converters that can handle modulated speech bandwidth on even a very low frequency IF and manage as much dynamic range as the best all-analogue radios. The temptation is to use DSP at the end of something like a common IF strip with an extra mix-down to some very low IF, and to use AGC of the IF to try to substitute for converter dynamic range. The problem comes when the DSP is doing tighter filtering than the early IF filter, or creating notches, when there are some frequencies where the DSP is removing an interfering signal, but that signal is still passing down the IF and into the converter. Because the gain/selectivity profile is what counts, we get something akin to the limitations of audio filters.

I've got great hopes for DSP based receivers, and I've been watching the analogue-to-digital converter scene carefully for some years, but I think they are still noticably short of the performance of the better analogue radios.

In moderate-to- bad conditions, their versatility is a great advantage, and they are most dramatic, yet when trying to extract a weak signal in extreme conditions; close to a very strong one, you can lose it due to overload when an analogue radio would still manage.

Things are changing fast, but I'm looking for a converter that can digitise, say, a 15 kHz IF with *at least* 18 bits of true, reliable, dynamic range. Remember, digital systems don't degrade gracefully, they just hit endstops, hard, so you need to be very careful about overload margins. I would use such a converter in a receiver that had very little overall gain from the antenna to the converter. These have not yet emerged on the industrial/military market, and there would be a further delay before the price entered the amateur range, and new transceivers were designed around them. (not just stuck on the tail end, a full new design from scratch is needed)

On transmit, the dynamic range demands are far easier, and there is the possibility of some marvellous ssb generators, and also some very interesting speech processors.

I would not sink a lot of hard-earned personal cash into a commercial "DSP radio". Prediction is notoriously dangerous, so let's just say I'm not holding my breath !

If you can find a nice, clean, IC765 being sold off by someone who just HAS to have the latest, or ex-demo, I reckon you could safely use if for at least a few years before the DSP brigade actually overtakes it.

Just my personal opinions and guesses, but I hope they help,

David GM4ZNX

Source record: 213507

In article <418vmg$pf2@ixnews6.ix.netcom.com> amnet@ix.netcom.com (ANDRES MARTINEZ) writes:
>Is it safe to use a battery charger (2 or 10 Amps) to power a TS-50s in low power?
>I measured the voltage and it fluctuates between 10.8 and 11.5 volts.

You might want to re-check that reading with an oscilloscope. Battery chargers typically put out unfiltered rectified AC. To charge a "12" volt battery (really 13.8 volts at full charge) requires a charging voltage *greater* than the final battery voltage. That voltage is typically 14.5 to 14.8 volts if smoothed DC, but may be 18 or higher volts if pulsed. A VOM won't read that pulsating DC very accurately, so if the charger can charge a battery, expect its peak voltage to be much greater than 11 volts.

Those high peak voltages won't be good for your TS-50. If, OTOH, the voltage *really is 10.8 to 11.5 volts, then that's not enough and the radio will misbehave due to too little supply voltage. The efficiency of solid state amplifiers drops quickly and radically as supply voltage declines. Hence most solid state radios prefer to run off of a regulated voltage source.

So, what to do? Well you can add filter capacitors to the battery charger to smooth the DC. That will likely boost the DC voltage you read on a VOM to about 1.41 times what it's reading now, IE about 15.2 to 16.2 volts. That's about the voltage you'd expect from a battery charger with no load applied. When you load it with the radio, those voltages will drop due to saturation effects in the transformer, and would probably work the radio without too many problems. However, a better solution is to just put a 12 volt battery across the charger. A battery is a pretty good DC "filter" and load, so the terminal voltage will then fall to close to the 13.8 volts your radio wants, and will be relatively free of hum and noise. Plus you can run the radio for a while after the power goes off from just the battery. While you can use an ordinary auto battery, I typically prefer to use a gell cell indoors because there are no battery fumes or chances of spilled acid.

Source record: 213511

Whenever I tune my Yaesu FT757GX on 20m with the G5RV, which is a resonant antenna on 20m giving a close to perfect match with the aid of a small transmatch, the frequency display flashes and vanishes when I turn up the pure carrier rf output to maximum. It does the same thing to some degree on 40m. Can anyone explain this phenomenon? Thanks. --Bill KB8USZ pruth@ocvaxa.cc.oberlin.edu

853. New Antenna for C508A

Newsgroup: rec.radio.amateur.equipment
Date: 1995-08-21 00:00:00 UTC
From: dddavis@mindspring.com
Message-ID: <dddavis.13.0010A0E6@mindspring.com>
Source record: 213514

For those C508A owners who want to boost the performance a little, Comet makes a new antenna (with the proper connector) called the SMA3. My brother in law just bought one at the Huntsville Hamfest, and it really does well. It fits the radio nicely, although it's a little long. We checked stations that didn't even show one "bar" on the S meter, and they were 3/4 or even full scale with this thing. It especially helped on receive of VHF channels outside the HAM bands, such as weather. You may have to convince your dealer that it really exists. It just came out and many had not heard of it. Also, it wasn't exactly cheap (he paid $36), but if you need the extra performance and SMA/BNC adaptors don't suit you, this is the ticket.
PS - I have no financial interest (and no money after too many Hamfests) - just passing info. Don (KE4KYO)

854. Heath HD-20 Crystal Calibrator info nee

>I have it and it might be nice to be able to use it!
>
>Thanks,
>Tony - AA0SM

I have the one that plugs in like a tube (8 pin socket). It uses one tube
and the large 100kHz crystal, in fact it plugged right into an HW-16.
I don't remember the HD-20. There are two types of batteries that it
might use. One is a 9 volt battery that looks like a fat AA-cell with
the sockets on each end. The other is a 45 volt battery that is
about the size of a D-cell. If your calibrator is solid-state it is most
likely the 9 volt battery. You might try using a standard 9 volt battery,
the polarity on the battery is the same.
This probably want much help. If you want that old tube/crystal calibrator
I'd be happy to send it to you.

Offhand, it sounds like you may have a problem with RF getting into the radio. Do you have a good ground connection?

Many weird feedback related problems can be attributed to having a TNC hooked up to one the rear panel accessory audio input lines -- these are typically high (10K) impedance and are just ripe for letting RF into the box.

Another typical problem that can cause wacko displays is poor grounding on the display board in the radio. Sometimes a "fix" is as simple as just loosening and then resnugging the screws that hold the board in place and (presumably) provide one of the important chassis grounds. I've seen these symptoms occur with RF causing problems in the power supply for the display. Often, these displays use -5V dc-dc converters that lose it in the presence of stray RF.

You might check it when running into a dummy load to see if you're getting radiated RF into the box, or maybe have some kind of internal problem.

Greetings!

i was the one who posted the "help, lost my AM", but now have the answer!

WA4VRV mailed me that the mod worked fine for him, so i retraced my steps in the mod, and realized that i cut the green-wire AND removed the diodes. Well, the mod works if you DO NOT CUT TE GREEN WIRE! found this out by reconnecting the green-wire, and it works fine now (even the 300-399mhz and AM/FM switch in the menu which i dont really understand)

so, remove the diodes, but not the LGW.

as to your keypad not functioning, check the film-ribbon-connector cable bettween the two halfs, and very carefully inspect your diode solder removal job. it doesnt take a whole lot of sloppiness to short this puppy out!

From: fiz <fiz@lamar.colostate.edu>
Message-ID: <41aupj$4mt9@yuma.ACNS.ColoState.EDU>
Source record: 213518

Hi,

I bought a Kenwood TM-241A this spring...One of the questions I explicitely asked was, "Does this radio receive aircraft transmissions?"...The reply, "Yes it does"...To make a long story short, I hauled the radio around in my car trying to hear friends in airplanes...Never a peep...Finally I sent the radio back to Kenwood to be checked..."No problem found"...So I talked with a rep...The official party line at Kenwood is the TM-241A WILL receive aircraft, providing it gets at LEAST a 50 MILLIWATT signal...How strong is that, you ask?...Well, the 2 meter signals it receives only need to be 0.25 MICROWATTS...

And it took them over a month to figure out my radio works fine...

So, I plan to sell it to the first sucker I find and buy a new mobile rig...Seriously considering an Alinco based on the service I've received on my HT (fast repair, easily to get info from the company)...

AND I WILL NEVER BUY A KENWOOD AGAIN...

ttfn fiz (KG0YG)

>appreciate any information anyone could provide.

I have had a 2GXAT for the last year. It takes a licking and keeps on ticking. So far I have:

1). Dropped the radio onto pavement while running full sprint.

2). Exposed the radio to rain and snow, including having snow packed into the pouch it was in. From falling while skiing.

3). Submerged the radio in ice-cold water when I fell into a creek while backpacking.

4). Generally abused the unit.

The only physical damage was the result of 1). The top left corner of the front panel was mashed in, and the key nearest that damage was stuck. I just took apart the radio and filed the hole for that key back to it's original size.

It is a very rugged radio.

I've had my Yaesu since Jan. and love it. It has great expanded receive
broader than the Kenwood. It can be programmed via the PC unlike the
Kenwood. RT systems sells the Windows based software for $40 with the
cable. It also allows you to expand the receive even more.

Ronan ---

Take a close look at the Sony 2010 (also called 2001, I believe, outside of
the US.)

The 2010 is one dynamite radio. The synchronous detector is superb at cutting
out adjacent channel interference. In any event, any radio with a synchronous
detector is better than one without. And, you will have no trouble receiving
the BBC here. I believe it may be relayed from Canada, which may account for
the strong signal.

Paul

Message-ID: <john-2108950526090001@wd1v.mv.com>
Source record: 213580

The new Macintosh Ham Test Simulators are HERE!

Novice Ham Test 5.0 SA.sea
Technician Ham Test 5.0 SA.sea
General Ham Test 5.0 SA.sea
Advanced Ham Test 5.0 SA.sea
Extra Ham Test 5.0 SA.sea

The latest versions feature:

HyperCard 2.3 as a stand-alone application (SA) eliminating
the need to have HyperCard. All you need is a Mac with 4
Meg of memory and version System 7 or greater.

Each version 5 Ham Test Simulator has the latest questions
as prepared by the Question Pool Committee.

Each Ham Test Simulator is FREE OF CHARGE and work the
same way as the originals written by Diana, KC1SP.

You may obtain a Ham Test Simulator by mailing me a *FORMATTED
disk (1 per test) and include a Self Addressed and Stamped disk
mailer for the return.

Each Ham Test Simulator is also bundled with a shareware CW
program called MacMorse 1.4 written by Doug, WB0EON.

Also included are a collection of text files that relate an
interesting variety of ideas about the best way to study CW and
prepare for tests.

or warm your phone line and get just the tests:

America On Line - Macintosh Ham Radio Section

ftp://oak.oakland.edu//pub3/hamradio/mac/theory-and-morse/AdvancedHamTest1.sea.bin
ftp://oak.oakland.edu//pub3/hamradio/mac/theory-and-morse/ExtraHamTest.sea.bin
ftp://oak.oakland.edu//pub3/hamradio/mac/theory-and-morse/GeneralHamTest.sea.bin
ftp://oak.oakland.edu//pub3/hamradio/mac/theory-and-morse/NoviceHamTest.sea.bin
ftp://oak.oakland.edu//pub3/hamradio/mac/theory-and-morse/TechnicianHamTest.sea.bin

Your comments and suggestions for future versions are always
welcome. Stay in touch and good luck with your next test!

870. Battery Charger as DC power supply?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-08-21 00:00:00 UTC
From: amnet@ix.netcom.com
Message-ID: <418vmg$pf2@ixnews6.ix.netcom.com>
Source record: 213584

Is it safe to use a battery charger (2 or 10 Amps) to power a TS-50s in low power?
I measured the voltage and it fluctuates between 10.8 and 11.5 volts.
thanks
andres Martinez
amnet@ix.netcom.com

From: atanner <atanner@infi.net>
Message-ID: <4193a6$hai@allnews.infi.net>
Source record: 213585

It's probably safe enough but a battery charger does not usually filter its DC output and you would get a great deal of hum and put out a terrible if unuseable signal. A better idea might be to let the charger trickle charge a good auto battery. Use the auto battery to run the radio and the charger to charge the battery when the radio is not in use. You could try using the charger at the same time you are running the radio on the battery but my guess is it will still poduce too much hum.

And anyway, I think the radio rules and regs still require a clean DC signal at frequencies below the 2M band and good engineering practice demands it on any frequency.

Can anyone offer me any constructive criticism or compliments regarding the Radio Shack HTX-212 2m mobile? Also it is important to me that it can be modified for up to 174 TX. I understand that there is a key-pad combination to allow it to RX up to that freq. but I would like to know if and how it can TX.
Thanks, Jeff

>are reliable, I'd appreciate it!

Lambda power supplies have been around for many years - they are
absolute top quality BUT...

One blew up a 6m radio once. This is not intended to be a blanket
condemnation, just relaying a story about one particular power supply.
A friend had a 6m Motorola "PT" series radio - these are the ones that
are hand carried like a lunch pail. He was tuning it up, and as the
power cameup it apparently affected the regulator in the power suply and
the supply output went to about 20+ volts.

On the other hand, I am using one (with a coule of bypass caps) to run
a 20w 220 radio, a third on a 2m packet station, and a 4th running
a repeater receiver. After my friend Doug's experience, I always
bypass ALL power supplies, at the regulator board if possible.

Note the jumpers between the output and sense pins. Don't remove them.
replace them with 1k resistors, but don't remove them.

>
> Does anybody know if there is one?

Yes, there is. This is simply one of those "every year so we take it for granted" 'fests where the organizers neglected to send the necessary press releases to the magazines. This seems to be a "disease" which is sweeping through the ham community here, and it's making it very difficult to attract major vendors to the local hamfests.

This hamfest is sponsored by the St. Charles Amateur Radio Club, and takes place Sunday, August 27, at Blanchette Park in St. Charles, MO. Admission is free, but you are encouraged to buy raffle tickets for significant equipment (at least a dual-band HT and a power supply are in the drawing; there might even be a major HF rig, too). I'm not 100% sure of the times, but I think the outside area opens at 7:00 a.m., with the inside vendor area open at 8:00 a.m. Talk-in is on the 146.670- repeater.

Hope that was of some help.

Paul,

Since AEA quit making them over a year ago they have grown in value. They
were a great keyer.

A friend of mine just paid $210 for a clean one and he thought he got a great
deal.

Its great to see a clasic product gain in value.

>for the low battery indicator to kick in (about 1.07 volt/cell)

You have a shorted cell in the battery. When you measure 6.9 V, this is only on 5 cells, so the actual voltage is 1.38 volts per cell, which is typical for a battery that is being charged/just been charged. If all 6 cells were good, the battery voltage would be approximately 8.4 V (1.4 V per cell) just after charging.

I'm assuming this is a typical HT plastic-encapsulated battery. Generally, there is no way to repair shorted cells from outside the battery. You need to open the case up (usually by cracking the glue at the seams) and get electrical access to the cells individually inside.

Since this pack is fairly new, it may be possible to "zap" the shorted cell and restore normal operation. Once the pack is open, test each cell individually until you find the one reading zero volts. It is *not* necessary to disconnect the connections inbetween the cells. "Zapping" is based on applying several 10s of amps of charge current for a fraction of a second. This will hopefully burn out the short inside the cell without burning out the internal connections in it. The result of over-zapping is generally an open cell.

Generally, charged capacitors (the big "computer grade" electrolytics, 50K uF at 20 V or so), and NiCd cells are recommended as sources for the zapping current. As an initial attempt, a well-charged D-cell NiCd connected directly to the shorted cell with heavy connections is relatively safe. I have also had good results using a 12V battery with a 6A *magnetic* circuit breaker in series as a timer. After each "zap", connect the slow charger to the pack and observe if the voltage of the previously shorted cell rises to 1-1.2 V. If it does, consider the zap successful and charge the pack for at least 15 hours.

It is also possible to under-zap, leaving a partial short. Should that happen, the cell will discharge by itself within a few days, and eventually become re-shorted. If it becomes shorted hard again, another zap may work

but you should start considering replacing the cell or the pack.

For about $10-$20, you can obtain an "insert" of new cells already taped and welded together to fit your pack. Once you have the pack open, it is quite simple to rebuild it by installing one of these, giving new performance for 1/4 to 1/2 of the new price. This is a lot less headache than trying to zap cells, and is definitely recommended if the pack is more than a year or two old. The newer cells often claim increased capacity over the ones supplied by the pack manufacturer as well.

Cell reversal occurs when one of the cells in the pack discharges completely, and current flow out of the pack causes it to "charge" with reverse polarity. This causes a short very quickly. Cell reversal is preventable by (1) never discharging the pack completely and (2) always charge enough that all cells reach full charge. Overcharging with the slow charger causes damage slowly, mostly due to heat buildup. This is much preferable to a pattern of undercharging will almost certainly cause one cell to reverse and a catastrophic failure from a short.

-Mike KD4QDM

881. Charging Nicads?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-08-21 00:00:00 UTC
From: g-taylor4@tamu.edu
Message-ID: <41angp$8pj@news.tamu.edu>
Source record: 213595
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc

Have what I assume is a six cell nicad battery pack less than 4 months old and
not used very often that only once or twice have I gotten to take full rated value
of 1.2 volts/cell (7.2 volts). Typical behavior is to charge to about 1.15 volts per
cell and won't take any more even after 12-14-16 hours. Anyhow, doesn't take long
for the low battery indicator to kick in (about 1.07 volt/cell)

Is this the dreaded memory effect? Pulling out the files, articles I've found seem to
indicate this is an overrated and unlikely phenomena in typical amateur use. Have seen
some references to cell reversal....could this be whats going on? Have tried a combination
of
deep and shallow discharge, per manual (10 hours) and longer charge times but situation
continues.

Any suggestions besides spending bucks on a new battery pack.

Tnx....Greg, KD4HZ

Tony,

If you are an experimenter-builder, Hamtronics sells a
receiving converter and a linear transmitting converter. I bought these
and built a very nice transverter for 2 Meters. What fun!

Moderate skill required for the system design but the converters
come as nice easy to assemble kits.

Just thought I'd share some alternatives.

The RS unit will not "actively" filter noise, such as line noise, QRN,
etc. What it Will do is remove as many carriers as necessary, including
heterodynes from adjacent frequencies. Also, in the widest position, AM
broadcast reception is enhanced under difficult conditions. If you try to
go much narrower, audio fidelity suffers too much. (The unit also works
very well as a narrow CW filter).
You can power the unit from any 12 v dc source.
Well worth 50.00.
John

893. Er 2 error msg. on HTX 20

Newsgroup: rec.radio.amateur.equipment
Date: 1995-08-22 00:00:00 UTC
From: clint.bradford@woodybbs.com
Message-ID: <93.3649.7583.0NFBAEE6@woodybbs.com>
Source record: 213457

Subject: Er 2 error msg. on HTX 202?

>>I have gotten this error msg. display in the LCD of my HTX202

HTX-202 Error Codes (taken from a Radio Shack memo)

ER1 indicates an internal RAM error. It appears when the memory backup battery is dead, when something has caused the memory contents to become corrupt, or as a result of physical or static electric shock. To clear this error, turn off the unit. Then turn it back on while holding down the "function" and "D" buttons. This clears the memory. If the error returns after you clear the memory, service is required.

ER2 indicates a PLL unlock. The radio gives this error if the PLL alignment is off or if the transmitted signal interferes with the internal PLL frequency. This error has been reported most frequently when using the supplied "rubber ducky" antenna with either a high-power battery pack or with an external DC source.

According to the memo, the fix for this is to use an external antenna when using external DC power. The memo goes on to say that if the problem persists, send the transciever to the repair center.

I can second Gary's comments about ICOM. Right after I purchased my 820H I was attempting the expanded receive mod and slipped with the soldering iron and damaged a diode. Not only did ICOM ship the part to me at no charge, they also shipped a wiring and componet location sheet to assist me.

Gary Fiber in tech support has also been top notch for questions. He even emailed me on a Saturday about a problem I was having with a ICOM amp!

Needless to say I have purchased several ICOM unit since! Customer service is key and ICOM understands it!

I just got a Motorola Radius P200 handheld. It had been submerged for days in a flood, and it had been pronounced "unrepairable" and discarded...I fished it outta the trash, took it apart, scraped off the larger chunks of river mud, and now it works great.

I'm looking for the info I need to make it operate in the ham segment of its range (it sez on the case it can operate from 430 to 470 Mhz). Presumably, it is configured by a little gizmo that screw on top of it that mates with some contacts there - unfortunately, the vendor kept this when they threw it out, so I'll need a way to get one of these. Also need the rubber ducky antenna for it - as well, any general info would be welcome...

Sounds like a shorted or reversed cell. If you have never seen the
battery perform well, and it's only four months old, send it back to the
manufacturer. Tell them it does not seem to work properly and ask for a
replacement. I would bet they'll send you a new one.

You could disassemble the case and shock the bad cell back to life if
it's reversed. However there could still be damage that will result in
poor performance in the long term. My advise is to send it back and get
a good, fresh one.

Be careful about discharging below 1V per cell. That is normally what
causes reversal.

Must be an AGGIE_PACK !

No just kidding. I have a similar pack, that showed
these characteristics. Seems one of the six cells was
bad. Using a cheap volt meter, I ran the pack just
until the low battery indicator came on. Then, I
opened the pack, and checked voltage on each of the
cells. Five of the cells were 1.1 volts, and one cell
was around 0.95 volts. This was the 'bad' cell.
Replacing it fixed the pack back to new and it's given
no signs of failure after 2 years of normal ham use.

>g-taylor4@tamu.edu
Try checking the peak voltage of the charger on a scope. Or a different
charger. If it's OK, the problem is the pack. You're right that memory effect
is a pretty minor concern these days. But over heating during charge is a still
a big concern. Has this ever happened? If you are able to measure cell voltages
then you sould be able to see if one is reversed. But on the whole, I'd suspect
that you just have a defective cell, especially if the pack has always behaved
this way. /^\

Craig, I've had mine since June 95 (HAMCOM DALLAS). I used a Kenwood TH-77 before it and was a real Kenwood fan. I have been converted. It is the most radio for the money, no doubt. I use RT Systems software and they have set the standard that other handhelds will have to follow with the ability to program from your PC Computer. I don't think you will be disappointed. If you buy one, look at W & W associates for your batteries and such. They are considerably cheaper than the Yaesu stuff and have more capacity in some cases. 73's Floyd.....(WD5ENJ)

This question is related to another posted to R.R.A.Antenna.

>Hmmm, I think things are not as resonant as you think they are. A
>resonant antenna would not need a transmatch.

The G5RV *is* resonant on 20M, but it's impedance isn't 50 ohms
because it's 3/2 wavelengths. Unless a specific length feeder is
used to bring it to 50 ohms, the transmatch is necessary to match the
VSWR that results from the resistive mismatch.

>I suspect you have standing waves on the feedline and that when you
>turn up the power some of that voltages gets back into the rig and
>confuses the display.

VSWR won't cause RF currents on the outside of the shield. However,
if there is an imbalance in the G5RV system somewhere that is causing
these currents, VSWR can aggravate the symptoms.

To maintain balance, the ladder line must be completely in the clear
and not running parallel to the dipole. The dipole itself should also
be in the clear and should be physically symmetrical.

>You might be able to make a virtual ground by attaching a 1/4
>wavelength (at operating frequency) piece of wire to the rig and just
>run it along the baseboard of the shack.

That's an excellent idea for unbalanced antenna systems, but it
shouldn't be necessary here. If the antenna is causing RF in the
shack, there's an imbalance somewhere.

Surely you mean MilliVOLT and MicroVOLT.....(for 12db s/n etc)
Sounds a bit odd-does this receiver have both an AM section (for airband) AND
an FM discriminator for the amateur bands? Or does it try to use the FM receiver
to try and pick up AM signals?! If it does, I'm not surprised.

Cheers de

Is the 826 a mercury rectifier?

If so, there's a solid state plug-in replacement available. Alternatively, you can use a hi-volt recitfier module (try Silicon Alley) but be advised that the mercury rectifier tubes caused a significant voltage drop, so B+ may be too high with either "fix."

You may be able to resurrect the nonfunctional 826 by letting it sit right-side up in the chassis for a day, and then slowly bringing up the filament voltage with a variac. Be sure not to apply HV. Give it a couple hours to warm up, then bring the HV up on a second variac. YMMV, but sometimes it works.

Since the 1940s we've forgotten how to care for mercury rectifier tubes.

We've also mostly forgotten (or never experienced) the joy of sitting in a darkened ham shack with the lid off the power supply, using a big plate-modulated AM rig and watching the rectifiers and the PA plates flash and flicker. It's nearly as ggod as the Northern Lights.

Then why not add a filter to the charger? It would be a simple matter
(more than likely anyway) to add an electrolytic cap(s) to filter the
DC.

Gary, my BNC connector on this radio keeps coming loose ... and I took it apart and sure enough the center conductor had come loose. I tried to get it back right with my smalest soldering iron and made a connection ... yet it came loose again. I'm afraid I'll have to send it back to the factory. Also, in case anyone is interested, there is a software modification sequence to vastly extend receive coverage range on this radio. I did mine several years ago and don't remember it exactly -- but it involves holding down some buttons while powering on. I belive the hamnet forum on ComuServe has the procedure.

Hmmm, I think things are not as resonant as you think they are. A resonant antenna would not need a transmatch. I suspect you have standing waves on the feedline and that when you turn up the power some of that voltages gets back into the rig and confuses the display.

You might be able to make a virtual ground by attaching a 1/4 wavelength (at operating frequency) piece of wire to the rig and just run it along the baseboard of the shack.

Message-ID: <41did5$e7e@siesta.packet.net>
Source record: 213546

Doug,

572B will work just fine in a 30L-1. You won't get anymore power out but they will last forever. Collins recommends that you change out one of the one of the caps in the 30L-1 for best operation with a 572B but I've tried them with a stock unit and it seemed to work fine. If your really interested in this mod I can dig through my stuff and tell you which cap to change.

As far as the ceramic based 811A, I've used bakelite 811 and 811A tubes for years and have never found any problems. I wouldn't spend any extra for a ceramic base but if its the same price, why not!

Subject: Battery Charger as DC power supply?
From: ANDRES MARTINEZ, amnet@ix.netcom.com
In article <418vmg$pf2@ixnews6.ix.netcom.com> ANDRES MARTINEZ, amnet@ix.netcom.com writes:
>Is it safe to use a battery charger (2 or 10 Amps) to power a TS-50s in low power?

I would not use the charger alone to power a valuable rig, but in parallel with a battery it should work fine.

I use a battery which is in parallel with a battery charger to power my TS850S. This setup works fine, and is relatively expensive.

The battery is a 110 AH deep cycle discharge marine battery. The charger is a "6 amp solid state controlled automatic charger". I obtained the battery at Sams for $45 and already had the charger. New similar chargers run about $30 or so. Chargers are also common on the garage sale circuit for $5 or so. Normal automobile batteries cannot take repeated deep discharges, so they shoudl be avoided if you are buying a new battery, particularly as the deep cycle batteries are widely available and not expensive. The automobile battery may be ok for casual use, particualrly if they can be obtained free or cheaply.

I have used this setup for about a year and a half with no problems. It has some benefits too; as the radio is always powered the memory for the keyer remains when the radio is turned off.

I operated CW sweepstakes last year and after the 24 hours, 29 total with 5 off for sleep, the battery still had a respectable charge left with indication of about 12 volts.

The setup is not pefect. After the battery charger has been on for 4 or 5 hours at maximum charge the thermal overload protection starts to cycle on and off. I will add a fan before this years sweepstakes. More battery capacity could be had by using two 6 volt golf cart ("traction") batteries in series. These are also available at Sams. A used 14.4 volt 5 or 6 amp supply may be a better choice than the charger; they are available in surplus emporiums around here for $20 or so.

The whole thing is cheaper than a commercial DC supply at $120 or so, and has the advantage that it can be used when the 120 Vac goes out. I can get about two to three weeks of casual operating, 2 or 3 hours a day out of the battery alone, without the charger.

The battery is housed in a garbage bag to contain any acid spills, but a battery case for marine use would also provide protection. I check water on a irregular basis, and add a bit about once a year. The battery occassiuonally "burps" when approaching a full charge.

921. 572B tube in Collins 30L1 ???

Newsgroup: rec.radio.amateur.equipment
Date: 1995-08-22 00:00:00 UTC
From: dsnowden@ccd.harris.com
Message-ID: <41cv9f$bfvl@rs2.ccd.harris.com>
Source record: 213550

Subject says it. Will the 572B tube fit in the 30L1? Physically? It might be a bit bigger than the 811A tube, I don't know. If it will fit, is it electrically near the 811A? What is the result, more power? More reliablity? Or a waste of money?

Along the same line, what is the advantage of using a ceramic based 811A as opposed to the bakelite based ones? I see RF parts advertise the ceramic based ones at quite a bit more money..

Have several vintage goodies in fairly poor condition. Price is free, but you must pick up at my convenience in St. Louis County MO. No documentation at all. All or none

1. Johnson Viking II with VFO, all freq, most mods.

2. National RAO-2 surplus WWII receiver. Actually NC200 with extra RF stage to prevent LO radiation which sunk some PT boats.

3. RME Preselector.

4. Few other bits and pieces. 450 mhz MOTRAC.

Will not check newsgroup. Reply via EMAIL only. No telephone or snail mail. Prefer St. Louis area only.

The 572B is virtually identical to the 811A but with a much greater
plate dissipation (160W VS 65W). Unfortunately, in order to make use
of that additional dissipation, you need to raise the plate
supply to about 2500V. Personally, I wouldn't spend the extra money
as replacements for the Collins.

>Along the same line, what is the advantage of using a ceramic based
>811A as opposed to the bakelite based ones? I see RF parts advertise

I'm not aware of any advantages offered by the ceramis base, but maybe
there's another reason for the price difference. Wonder if the
ceramics are U.S. made?

If this radio is similiar to my old IC-255A one of the pins on the mike connector if grounded will start the VCO incrementing and a 1K ohm resistor across the pin to ground will start the VCO decrementing, or visa versa. Hope this helps.

930. DSP and noise reduction

Newsgroup: rec.radio.amateur.equipment
Date: 1995-08-23 00:00:00 UTC
From: jason@fir.canberra.edu.au
Message-ID: <jason.809177794@fir>
Source record: 213468
Cross-posted to: comp.dsp,rec.radio.amateur.equipment

I am doing some research into noise reduction techniques using DSP. What I have in mind is for application to the receiver of a radio system. The noise reduction can be applied to the already extracted signal (ie make a noisy audio signal a bit nicer to listen to) or a bit closer to the IF stage for noise reduction and signal extraction. I have heard there are devices in the amateur radio market for the former and I am interested in techniques and algorithms for both requests. I would appreciate any info or pointers to literature, programs, maths etc.

Thanks in advance,

I just got a Kenwood TW-4100E and I am looking for the functions of the
diodes in the frontpanel. I found mods for TX/RX extention with the diodes
D6 (UHF) and D8 (VHF).
In my 4100E version are the D1, D2, D3, D4 and D5 already removed and
in the 4100A version are the D3, D4, D5 and D7 already removed.
So I am looking for functions of these diode if they are installed/removed.

It is suitable for short and intermittent QSO only as it gets hot very
quickly. Look out for the screw holding the BNC jack. Mine got lost after
the antennae started to wibble.

: be welcome...

Great find, it is a good radio, and works well on 440 MHz. It is indeed programmed through the connector on top. The intermediate box between the radio and the PC is called a RIB, and you can find those around also. However, the software is from Motorola only, available (licensed, not sold) through them, at a very high cost.

Your best bet, go to a local Motorola shop, tell them what frequencies you want in it, and they will program it, for a fee. They also can get an antenna for it easily.

A friend of mine has a C508A mod'd for full 800 Mhz receive coverage. The mod was done at a hamfest by a "radio mod" guy, so he didn't know how it was done. Does anyone here have that info? Thanks in advance.

945. Heathkit HO-10 Monitor Scope question.

Newsgroup: rec.radio.amateur.equipment
Date: 1995-08-23 00:00:00 UTC
From: jeff.sumberg@sailboard.com
Message-ID: <8AFB2EA.012D0018EC.uuout@sailboard.com>
Source record: 213483

I recently bought a Heathkit HO-10 monitor scope at a hamfest. I'd like to locate somebody else with one of these. I have two questions to ask you:

1 - Do you have the manual? I am missing page 41 of my manual. The manual say "Condensed Manual" on the front, and carries the number 595-578-1. I'd like to get the missing page. (scanned->UUencode->Email, or FAX, or mail a copy).

2 - When the scope is in operation, the trace appears as a broken line rather than a solid line from edge to edge. As you turn up the sweep rate, the segments get smaller and more of them appear across the face of the tube (about 2 segments when slow, about 6-10 when at fast sweep). Is this normal operation? The unit works fine, and the displayed patterns look good, except for this "broken up" appearance.

This isn't the way they are shown in the manual which leads me to believe there is some signal, like a square wave, riding on the vertical deflection section (just a guess). I figured before I looked into the unit I'd ask.

Thanks in advance.

946. 2m/70cm mobile: Kenwood TM-733A - Opinions?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-08-23 00:00:00 UTC
From: Simon Twigger <simont@post.its.mcw.edu>
Message-ID: <41g2hn$gkl@post.its.mcw.edu>
Source record: 213484

Hi there,

I am considering buying the Kenwood TM-733A 2m/70cm mobile rig and I
was wondering what experiences people have had with this radio. I am
basically looking to buy a 2m/70cm mobile rig with a removable front
so I can mount the main body of the rig in the trunk of the car and
have the display up front. I dont think I can install a mobile rig
in my car (honda Civic 4dr) any other way.
If anyone has any opinions on this or any other radio that fits
the bill, I would be interested to hear them.

Thanks for your help!

Simon

949. DSP Filter Advice??

Newsgroup: rec.radio.amateur.equipment
Date: 1995-08-23 00:00:00 UTC
From: tuck@europa.com
Message-ID: <tuck-2308951638490001@walkingstick.europa.com>
Source record: 213487

I operate CW most of the time and am interested in either the Timewave 59+ or MFJ 784B. Any advice? The areas of most concern are:

Does the unit generate its own noise? This is really irritating when I use an AF to filter out faults in the receiver (hiss, AGC pop) as well as for selectivity. I listen with headphones. QST panned the 59+ in this area.

How does the unit handle CW spotting? Can you hear your own sidetone if it's the same frequency as the received signal?

How well does the noise reducton feature work?

Thanks Gary WB7FCQ

955. K-com filters and Telephone RFI

Newsgroup: rec.radio.amateur.equipment
Date: 1995-08-24 00:00:00 UTC
From: kcs@merc.rx.uga.edu
Message-ID: <kcs.32.000E8569@merc.rx.uga.edu>
Source record: 213403

Anyone out there with experience with K-com telephone RFI filters? Specfically, do they work and how do they work? Are they tuned circuits or just common mode ferrite chokes? If they are just ferrite, then they would appear to be a little pricey relative to the typical snap on ferrite chokes which are widely available. I've got a bit of telephone RFI (100w, SSB, 80 - 10m, low dipoles) so far no luck with ferrite. Which of course brings up another question - how much ferrite at the back of the phone do you need to choke HF off a telephone line? I suspect that a single ferrite snap on choke may not be effective below VHF. Any and all comment appreciated.

From: nepaleduc@aol.com
Message-ID: <41iltd$mgt@newsbf02.news.aol.com>
Source record: 213405

Hi,

I have noted that my C508A picks up cellular conversations on the image frequency. The C508A first IF is 23.05 MHz, so my guess is that the images will be 46.1 MHz higher than the 870-890 MHz cell site outputs, ie 916.1MHz to 936.1 MHz. Set the frequency offset to 30 KHz and snoop away!

The image sensitivity is of course not good - I live on a hill and the S meter doesn't go to S9, but it seems better than having a mods butcher pulling such an intricate package apart!

Cheers,

For those interested in using BNC antennas on the C508A's SMA connector, there are adapters available from electronics supply houses at about $40! I managed to score one for $6 (SMA male to BNC female), plus others at 'OEM parts' in Colorado Springs, (719) 635 0771. (Note I have nothing to gain from this - just helping out other hams).

Of course, mounting a BNC connector on such a tiny HT tends to stress the mechanics of the SMA connector. Best way is to let the HT hang off the BNC antenna .....

In reading your comments one thing came to mind " misery loves company".
I also bought a TM-241A and quickley found that the aircraft recieve band
had nothing on it! Well, I also have a TH-79A and compared the aircraft
band on that HT (which works great) to that on my TM-241A and to my
supprize the HT was picking up even weak ATIS signals from airports 10
miles away, while on the 241A I can be but a 1/4 mile away from a tower
and only then does the signal come in with any strength. Forget any
reception on the aircraft band on the 241A outside of a few miles. Why
Kenwood would make a great AM reciever in their HT's and not follow that
up on their mobile rigs to me just does not make since. At any rate I
have in the past bought HF rigs off Kenwood (and been very haapy) and now
I think their quality is slipping. As a P.I.T. (Pilot-In-Training) It
was a selling point for me on the 241A, (not a major one though) but I
guess the AM aircraft recieve on my HT will have to suffice.

I am a new ham and bought my first radio, a TM-241A, a couple months ago for my '93 Suburban. I can't really give a technical evaluation but I like it. It's easy to operate, works well, is very compact and looks good. There are areas, especially downtown, where intermod is pretty bad but other radios seem to have similar problems in those areas. I don't have a lot to compare the aircraft band reception to but it definately does work. I do have to open the squelch up to receive on the aircraft band.

I am thinking seriously about a TH-79A(D) next.

961. Kenwood TS-520S fixed frequency?????

Hey all,
I have a Kenwood TS-520S HF transceiver, and I see that it has a
4-position
switch for fixed-frequency operation - just plug in the crystal and you're
set. I'm almost ashamed to admit this, but I'm a closet shortwave
listener
too, and to get a crystal (using the calculations in the manual) set to a
sideband of, say, the BBC on 7,325 kHz would be truly the cats meow.
Anybody out there with Kenwood TS-520S fixed frequency experience, and
know of a source for crystals using an HC -25/U holder? Thanks a bunch.
Sincerely,
Bill

Someone posted here a few weeks ago a software mod for this radio using the software program that was written for it. He said that all you need to do is change the line allowanyfrequency=0 to allowanyfrequency=1 in the win.ini file (the line should be under a section toward the end of the file if you just installed the program). I haven't tried it on my radio yet, so I can't tell you if it works or not. Sounds like a much better way to mod your radio without cracking the case open. THe poster also said that the radio was completely deaf at the 800 and 900MHz range. I think it might be missing some parts for that.

Good luck

Max

>design from scratch is needed)

Commercial flash converters that can handle HF are rarely over 8 bit resolution, and that's not nearly enough. A bit of clever scaling should let you parallel two of these to get 16 bits. But these converters are still in the $100 range, I think that may be the wrong approach.

A 1 bit flash converter working at HF is rather trivial, even in discretes. It seems to me that using a heavily oversampled 1 bit converter and decimation of the resulting bit stream should give us what we want without needing to wait for the chip makers to give us an integrated solution. Remember, we only have to sample at a multiple of the receiving *bandwidth*, and not at a mulitiple of the actual IF frequency because such sampling aliases down to baseband. Opinions?

Overloads easily, and has a terrible noise figure. Mutek (England)
has a replacement front end board that will fix this radio. I've
used it in a IC211, and it does wonders for strong signal handling
and for reducing the system noise figure.

>resonant antenna would not need a transmatch. I suspect you have
>standing waves on the feedline and that when you turn up the power
>some of that voltages gets back into the rig and confuses the display.

A resonant antenna can indeed need a transmatch. All resonance means
is that there's no net reactive component at the feedpoint. The
resistive component could be anything, depending on the particular
antenna geometry, and may need a transmatch to transform that impedance
to 50 ohms. In the case of a G5RV, it's longer than a halfwave
on 20 meters, 3/2-waves in fact. The feedpoint impedance should be
moderate, somewhere not too far from 50 ohms, but the G5RV is fed
with a 300 ohm balanced line section terminated into a coax. You're
not going to get 1:1 SWR on that balanced line (and probably not
on the coax either).

The fact that the line has SWR, however, has nothing to do with
RF in the shack. That's a balance problem, not a matching problem.
SWR on the line just means there are circulating differential
currents *inside* the line that form a standing wave pattern.
They can't get *out* of the line to cause a hot chassis unless
there is a system imbalance and parallel currents are flowing
on the *outside* of the coax. (From the point of view of currents
flowing inside coax, it is a balanced line. It's only for currents
flowing on the outside of the coax that imbalance is an issue.)

There are two kinds of balance involved here, physical and electrical.
Physical balance is important because the induction field can induce
a common mode current on the coax shield. Electrical balance is important
because it can upset the differential current balance of the feedline.

Physical balance is a matter of laying out the antenna and feedline
in a symmetrical manner, IE both legs of the antenna need to be mirror
images of each other with respect to themselves and to Earth, and the
feedline should be routed to bisect that symmetry.

Electrical symmetry is pretty much automatic if physical symmetry is
followed with regard to the antenna and the balanced line section.

The point where the coax attaches, however, can create an electrical imbalance because shield currents can flow on both the inside and outside of the shield at this connection point. This creates an imbalance with respect to the currents flowing in the inner conductor. A choke balun here (6 to 8 tight turns of the coax will do) will restore the balance by stopping currents from flowing on the outside of the shield.

>You might be able to make a virtual ground by attaching a 1/4
>wavelength (at operating frequency) piece of wire to the rig and just
>run it along the baseboard of the shack.

This may treat the *symptom*, but it doesn't address the cause. A bilaterally symmetric antenna does not need a ground, virtual or real, in order to perform properly. It's usually wise to treat the brain tumor rather than just taking aspirn to suppress the pain. Reserve grounds, virtual or otherwise, for feeding asymmetric antennas like longwires. *They* need that current mirror to replace the other half of their symmetry. If you try to compensate for a hot shield with a balance wire, you are still screwing up the antenna's design radiation pattern since the feedline is now part of the radiating structure.

You're learning. :-)

However, don't be so dogmatic, Kenwood may (insert miraculous intervention
of the Virgin here) get their act together with VHF/UHF rigs one day.
Remember, it wasn't that long ago when Yaesu couldn't build a HF rig,
now they're the top dog in that department. Changes can happen, so
keep your options open.

>this is my experience with them.
>73 gud luck
>kd4gan

Something was wrong with that Isopole, or its feedline. The 440 Isopole
is a very well made antenna, and normally works quite well. (Of course
it doesn't have the gain of a big colinear, but what did you expect?
It should easily outperform a Ringo or a rubber duck.)

The 2m Isopole is a bit cheesier, you have to supply the mast part
yourself. If you put it together right, and get good electrical
connections to the mast you supply, it'll still beat a 2m Ringo
(of course nearly anything will).

Hmmm, it seems I'm damning the Isopoles with faint praise. Well, they
aren't the best antennas out there, and they aren't the cheapest antennas
for what they do, but still they aren't as bad as your experience would
indicate.

[snip]

Yep, my ICOM 24-ATs had the same problem. The way I fixed 'em was
to slightly mash the threads on the BNC where the spanner nut holds
the BNC to the case, then torque the nut down as tightly as possible.
Then re-solder the wire inside the case. I had intended to locktite
the BNC but haven't needed to. They are staying in place despite
repeated duckie removal and car antenna hooking. Even the briefcase
bend hasn't bothered them. It's been well over a year since I fixed
them and so far no trouble.
The biggest trouble I have now is the ^%$#@* power jack keeps failing.

I bought my mom a Yaesu FT-51R a couple of weeks ago (with her money of course). I have been using it a lot while she waits for her license to come. I can tell you that when her license does come, I may just have to go out and buy one for myself. PC programming is definately the way to go. There are a couple of features on it that I don't think are very necessary, like the spectrum scope. But on a whole, I would say that it's a very good radio.

Gary,

I bought a DSP-59+ a few weeks ago and have been very pleased with it.
It does a great job on both CW and SSB, and the noise reduction works
very well. You can hear your sidetone; just set the center frequency
to your sidetone frequency.

QST didn't actually pan it for its noise, IMHO. Their review mentioned
that you could hear some noise if you cranked the gain way up in the
absence of a signal. The unit's noise is not noticeable at all in
normal operation. I can hear a little bit of noise if I crank it all
the way up with no signal input, but its noise is inaudible if I
feed it audio from the receiver, even with the RF gain all the way down.

I'm not very impressed with most MFJ stuff, and from what I've heard,
their DSP probably leaves much to be desired in both performance and
workmanship. Just my $0.02 worth on Mighty Fine Junk.

73,
Jeff, KC1MK

I have the Timewave 9+, thier middle unit, and think its fantastic. Works
fine and really helps pull the weak ones out of the noise. Use it mostly on
CW. I have a Icom IC736 and have some noise from the receiver. When using
the Timewave unit, all noise in the background is gone. Nice clear signal
and nothing else. Computer is much happier receiving CW with it too!

I did try the Radio Shack, and was disapointed. Then again it was less than
half as much. You will be happy with the Timewave unit, which ever unit
you do buy.

I'll tell you guys, if there is no published specification, or if the
preformance of the radio is not guaranteed outside of the Amateur Bands.
I think you do not have a leg to stand on here. Just because the radio may
not meet your requirements. If the RX sensitivity is 50 microvolts or
50 millivolts, it still does receive Aircraft A.M. There is no published
spec on just how far away you should be able to receive an Aircraft signal
from the actual source. You will need something more that "what it should be"
or " good engineering practice dictates " for proof. Many times bonuses are
thrown into radios, they do not have to be there.

Hopefully Hams will wake up someday and allow manufacturers to build radios designed for strict amateur operation, and buy scanners for the other purposes. You are giving away the amateur bands without knowing it here.

There are persons installing scramblers into amateur radios and using the amateur bands unlicensed. Sure it is illegel for scramblers to be installed, but who cares these days, not many amateurs seem to. Most Amateurs want D.C. to daylight radios and are not happy until the radio is modified and they can call to police in an emergency if the need arises. A strict amateur band only radio would not be as attractive to non amateurs. The non amateurs like the small size and frequency agility of the amateur radios. I once chatted with a fellow who used 2 small 440 MHz radios for communications with his plane. He was not licensed as an amateur. I told him it was illegal for him to operate in that frequency range, I got promptly told to mind my own business which I did. I have chatted with several persons like that fellow. I have even chatted with race car owners wanting to use the radios for race communications, light weight and small the amateur transceiver will work fine in a race car too.

I see many requests for mods for all the amateur transceivers here in usenet. I wonder just how many requesters are actually licensed ?

The point is There are many using amateur radios both with in the amateur bands and in the landmobile bands, most always unlicensed, all over the U.S.A. and the hams do not catch them either. The amateur radio is typically cheaper than the Land Mobile radio and the frequencies are more private. I am here to tell you amateurs are not the only people taking advantage of today's wide open amateur radios. These persons do not give a hoot for rules or licenses as business and safety are the first concerns.

These is no law that requires you to hold an Amateur license for purchasing an Amateur radio transceiver.

Yes, I've used a K-com filter on an at&t trimline-like phone (keypad in the handset). This was a newer electronic model that had a volume level switch for rcvd audio. It picked up rf bad enough to hear it across the room. After installing a K-com at the handset rf could still be heard, but it was less than 1/2 as loud as the voice at the other end of the line. Quite a reduction.
Inside the k-com is a torroid with maybe 30 turns of small gauge wire for each side of the line. So it appears to be just a choke. I assume it has quite a bit more inductance than you could get by wrapping the cord around a snap on choke.
Good luck with the rfi. If all else fails, you could always go back to an old ma bell model. They were pretty rf-proof.

: Steve, are you sure the battery power is dropping off or is it the
: radio that is reducing the transmit power output? I believe the user
: manual states that when you use a high power batter pack or DC
: adapter, the radio may overheat from the higher power output and when
: it overheats, it automatically reduces its output power level. I have
: never had mine get hot enough to completely quit transmitting, but it
: sounds like that might be your problem. I hope this helps...73's
: Floyd WD5ENJ

I'll add my two-cents worth here. You are both partially right.
I have had my FT51R heat up enough to shift to low power and then
to stop transmitting. You will notice that it is in low power
because the transmit scale will be half or a quarter of what it
would be in full power. When it finally overheats, it will actually
stop transmitting. That is your red transmit light will switch
to green even though you have the PTT pressed.

Unfortunately, except for the blisters on your palms, the transition
to low power and then no power associated with over heating is
indistinguishable from the same transitions you would see if you
were on low battery.

To answer the original question, my understanding is that the EDC-12
is a trickle charge, but that it does not bypass the battery, so you
can at high power draw more current from the battery than it is putting
in. I use the bulkier PA-10A, which does give you full power bypass
and trickle charge.

I hope that helps, and by the way, has anyone come up with a heat sync
for this radio? I have a couple of drawings, but I don't know what
material to use. Currently, I have had some sucess wrapping an ice
cube in a paper towel, and rubbing along the back of the radio. This

works best if you remove the belt clip and use a speaker mike. I know that this is unworkable for most folks, but it does work in a pinch. As long as you keep the radio dry, you can pull a lot of heat out of the radio in a few seconds.

Victor; I am interested in buying a 51r but this (the radio reducing output power when it gets hot) has me a little concerned. How long do you have to be transmitting before this happens? Is it any worse/better than other handhelds? And I was hoping to use the EDC 12 adapter for mobile use ... but it sounds like you could not expect a full 5 watts out with it (even with the 5 watt battery). Is this right?

The TM-241A does not have aircraft reception! Don't be fooled.

When modified, the display goes down to 118 MHz, but it only receives in
the FM mode, not AM. So aircraft can not be heard clearly.

Other than that, the radio is pretty good.

1018. HF Receiver Question?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-08-26 00:00:00 UTC
From: herbr@netcom.com
Message-ID: <herbrDDwK44.DL4@netcom.com>
Source record: 213356

I was listening to a conversation on 75 meters the other day. These two guys were talking about the best HF transcievers on the market, and one of them made the point that a rig that had a build in AC power supply always had better sensistivity, dynamic range, etc. than a radio that required a 12- 15 volt external power supply.

Is there any basis to that? He seem to be making a fairly convincing argument, although, I thought both rigs require 13-15 vold dc, whether it comes from an internal ac supply that converts it to 13-15 dc, or simply a rig that takes the dc direct.

I think they were serious top gunners, talking about top of the line world class radios.

I would apprecaite hearing any technical comments about this.

Thanks and 73's.

Herb, That's about as good as worrying about the color of paint. The
location of the supply and what it plugs into have no effect on the
parameters mentioned.
I can think of threads of logic that may be distorted into forming that
conclusion, but it is a giant leap.

You hear a lot of strange stuff if you listen long enough.

Actually there are some advantages to the internal supply approach,
but you're right, Tom - it has nothing to do with the location of the
supply. Some of the internal supplies run significantly more than
12-15 volts, and this can be an advantage in some cases. Better IMD
and spectral purity from the PA are easier to achieve at the higher
voltages (28 to 30 volts) that these internal supplies offer. It's
also easier to make a 200 watt PA when it runs on 28v, which is why
the 200w output rigs generally have internal power supplies.

One reason I can think of for that being true, is that most internal
power supplies are better built by the manufacturers than a cheap
external power supply a user may use in some cases. If you use a good
quality external power supply, then the should be no difference in
reception.

I would like a battery connection cover plate for my HTX-202 because when I operate from external power I'm supposed to take the battery pack off but that leaves the battery connectors to possibly get damaged, any ideas?

1031. mfj-8621 packet radio probs

Newsgroup: rec.radio.amateur.equipment
Date: 1995-08-26 00:00:00 UTC
From: billv@olympus.net
Message-ID: <billv.221.000A6A57@olympus.net>
Source record: 213369

I just received an mfj-8621 packet data radio (after waiting 8 months) I put new factory xtals in it and retuned the unit. After checking it with my service monitor I discovered that upon tx key the freq drifted from about 2k away to an onfrequency condition but it took aprx a second for it to do so.

I am delaying the tx key for that amount of time but it seems to negate the fast diode switching. It has no heater for the xtal but I have worked on many radios with no oven that did not do this. Any suggestions for a fix.

>resonant antenna would not need a transmatch. I suspect you have
>standing waves on the feedline and that when you turn up the power
>some of that voltages gets back into the rig and confuses the display.

A resonant antenna can indeed need a transmatch. All resonance means
is that there's no net reactive component at the feedpoint. The
resistive component could be anything, depending on the particular
antenna geometry, and may need a transmatch to transform that impedance
to 50 ohms. In the case of a G5RV, it's longer than a halfwave
on 20 meters, 3/2-waves in fact. The feedpoint impedance should be
moderate, somewhere not too far from 50 ohms, but the G5RV is fed
with a 300 ohm balanced line section terminated into a coax. You're
not going to get 1:1 SWR on that balanced line (and probably not
on the coax either).

The fact that the line has SWR, however, has nothing to do with
RF in the shack. That's a balance problem, not a matching problem.
SWR on the line just means there are circulating differential
currents *inside* the line that form a standing wave pattern.
They can't get *out* of the line to cause a hot chassis unless
there is a system imbalance and parallel currents are flowing
on the *outside* of the coax. (From the point of view of currents
flowing inside coax, it is a balanced line. It's only for currents
flowing on the outside of the coax that imbalance is an issue.)

There are two kinds of balance involved here, physical and electrical.
Physical balance is important because the induction field can induce
a common mode current on the coax shield. Electrical balance is important
because it can upset the differential current balance of the feedline.

Physical balance is a matter of laying out the antenna and feedline
in a symmetrical manner, IE both legs of the antenna need to be mirror
images of each other with respect to themselves and to Earth, and the
feedline should be routed to bisect that symmetry.

Electrical symmetry is pretty much automatic if physical symmetry is followed with regard to the antenna and the balanced line section. The point where the coax attaches, however, can create an electrical imbalance because shield currents can flow on both the inside and outside of the shield at this connection point. This creates an imbalance with respect to the currents flowing in the inner conductor. A choke balun here (6 to 8 tight turns of the coax will do) will restore the balance by stopping currents from flowing on the outside of the shield.

>You might be able to make a virtual ground by attaching a 1/4
>wavelength (at operating frequency) piece of wire to the rig and just
>run it along the baseboard of the shack.

This may treat the *symptom*, but it doesn't address the cause. A bilaterally symmetric antenna does not need a ground, virtual or real, in order to perform properly. It's usually wise to treat the brain tumor rather than just taking aspirn to suppress the pain. Reserve grounds, virtual or otherwise, for feeding asymmetric antennas like longwires. *They* need that current mirror to replace the other half of their symmetry. If you try to compensate for a hot shield with a balance wire, you are still screwing up the antenna's design radiation pattern since the feedline is now part of the radiating structure.

Subject: Good customer service - ICOM

I can second Gary's comments about ICOM. Right after I purchased my 820H I was attempting the expanded receive mod and slipped with the soldering iron and damaged a diode. Not only did ICOM ship the part to me at no charge, they also shipped a wiring and componet location sheet to assist me.

Gary Fiber in tech support has also been top notch for questions. He even emailed me on a Saturday about a problem I was having with a ICOM amp!

Needless to say I have purchased several ICOM unit since! Customer service is key and ICOM understands it!

Herb, That's about as good as worrying about the color of paint. The location of the supply and what it plugs into have no effect on the parameters mentioned.
I can think of threads of logic that may be distorted into forming that conclusion, but it is a giant leap.

You hear a lot of strange stuff if you listen long enough.

From: dsnowden@ccd.harris.com (Doug Snowden)
Subject: 572B tube in Collins 30L1 ???

Subject says it. Will the 572B tube fit in the 30L1? Physically? It
might be a bit bigger than the 811A tube, I don't know. If it will
fit, is it electrically near the 811A? What is the result, more power?
More reliablity? Or a waste of money?

Along the same line, what is the advantage of using a ceramic based
811A as opposed to the bakelite based ones? I see RF parts advertise
the ceramic based ones at quite a bit more money..

From: "Manuel A. Maseda WF1J" <mmaseda@packet.net>
Subject: 572B tube in Collins 30L1 ???

Doug,

572B will work just fine in a 30L-1. You won't get anymore
power out but they will last forever. Collins recommends that
you change out one of the one of the caps in the 30L-1 for
best operation with a 572B but I've tried them with a stock
unit and it seemed to work fine. If your really interested in
this mod I can dig through my stuff and tell you which cap to
change.

As far as the ceramic based 811A, I've used bakelite 811 and
811A tubes for years and have never found any problems. I
wouldn't spend any extra for a ceramic base but if its the same
price, why not!

From: nepaleduc@aol.com (Nepal educ)
Subject: 800 MHz mod - C508A

Hi,

I have noted that my C508A picks up cellular conversations on the image frequency. The C508A first IF is 23.05 MHz, so my guess is that the images will be 46.1 MHz higher than the 870-890 MHz cell site outputs, ie 916.1MHz to 936.1 MHz. Set the frequency offset to 30 KHz and snoop away!

The image sensitivity is of course not good - I live on a hill and the S meter doesn't go to S9, but it seems better than having a mods butcher pulling such an intricate package apart!

: Steve, are you sure the battery power is dropping off or is it the
: radio that is reducing the transmit power output? I believe the user
: manual states that when you use a high power batter pack or DC
: adapter, the radio may overheat from the higher power output and when
: it overheats, it automatically reduces its output power level. I have
: never had mine get hot enough to completely quit transmitting, but it
: sounds like that might be your problem. I hope this helps...73's
: Floyd WD5ENJ

I'll add my two-cents worth here. You are both partially right.
I have had my FT51R heat up enough to shift to low power and then
to stop transmitting. You will notice that it is in low power
because the transmit scale will be half or a quarter of what it
would be in full power. When it finally overheats, it will actually
stop transmitting. That is your red transmit light will switch
to green even though you have the PTT pressed.

Unfortunately, except for the blisters on your palms, the transition
to low power and then no power associated with over heating is
indistinguishable from the same transitions you would see if you
were on low battery.

To answer the original question, my understanding is that the EDC-12
is a trickle charge, but that it does not bypass the battery, so you
can at high power draw more current from the battery than it is putting
in. I use the bulkier PA-10A, which does give you full power bypass
and trickle charge.

I hope that helps, and by the way, has anyone come up with a heat sync
for this radio? I have a couple of drawings, but I don't know what
material to use. Currently, I have had some sucess wrapping an ice
cube in a paper towel, and rubbing along the back of the radio. This
works best if you remove the belt clip and use a speaker mike. I know
that this is unworkable for most folks, but it does work in a pinch.
As long as you keep the radio dry, you can pull a lot of heat out
of the radio in a few seconds.

Overloads easily, and has a terrible noise figure. Mutek (England)
has a replacement front end board that will fix this radio. I've
used it in a IC211, and it does wonders for strong signal handling
and for reducing the system noise figure.

From: dsnowden@ccd.harris.com (Doug Snowden)
Subject: 572B tube in Collins 30L1 ???

Subject says it. Will the 572B tube fit in the 30L1? Physically? It
might be a bit bigger than the 811A tube, I don't know. If it will
fit, is it electrically near the 811A? What is the result, more power?
More reliablity? Or a waste of money?

Along the same line, what is the advantage of using a ceramic based
811A as opposed to the bakelite based ones? I see RF parts advertise
the ceramic based ones at quite a bit more money..

Subject: 572B tube in Collins 30L1 ???

Doug,

572B will work just fine in a 30L-1. You won't get anymore
power out but they will last forever. Collins recommends that
you change out one of the one of the caps in the 30L-1 for
best operation with a 572B but I've tried them with a stock
unit and it seemed to work fine. If your really interested in
this mod I can dig through my stuff and tell you which cap to
change.

As far as the ceramic based 811A, I've used bakelite 811 and
811A tubes for years and have never found any problems. I
wouldn't spend any extra for a ceramic base but if its the same

price, why not!

From: nepaleduc@aol.com (Nepal educ)
Subject: 800 MHz mod - C508A

Hi,

I have noted that my C508A picks up cellular conversations on the image frequency. The C508A first IF is 23.05 MHz, so my guess is that the images will be 46.1 MHz higher than the 870-890 MHz cell site outputs, ie 916.1MHz to 936.1 MHz. Set the frequency offset to 30 KHz and snoop away!

The image sensitivity is of course not good - I live on a hill and the S meter doesn't go to S9, but it seems better than having a mods butcher pulling such an intricate package apart!

: >steve
: >KA5DLB
: >swdecato@nps.navy.mil

: Steve, are you sure the battery power is dropping off or is it the
: radio that is reducing the transmit power output? I believe the user
: manual states that when you use a high power batter pack or DC
: adapter, the radio may overheat from the higher power output and when
: it overheats, it automatically reduces its output power level. I have
: never had mine get hot enough to completely quit transmitting, but it
: sounds like that might be your problem. I hope this helps...73's
: Floyd WD5ENJ

I'll add my two-cents worth here. You are both partially right.
I have had my FT51R heat up enough to shift to low power and then
to stop transmitting. You will notice that it is in low power
because the transmit scale will be half or a quarter of what it
would be in full power. When it finally overheats, it will actually
stop transmitting. That is your red transmit light will switch
to green even though you have the PTT pressed.

Unfortunately, except for the blisters on your palms, the transition
to low power and then no power associated with over heating is
indistinguishable from the same transitions you would see if you
were on low battery.

To answer the original question, my understanding is that the EDC-12
is a trickle charge, but that it does not bypass the battery, so you
can at high power draw more current from the battery than it is putting
in. I use the bulkier PA-10A, which does give you full power bypass
and trickle charge.

I hope that helps, and by the way, has anyone come up with a heat sync
for this radio? I have a couple of drawings, but I don't know what
material to use. Currently, I have had some sucess wrapping an ice
cube in a paper towel, and rubbing along the back of the radio. This
works best if you remove the belt clip and use a speaker mike. I know
that this is unworkable for most folks, but it does work in a pinch.
As long as you keep the radio dry, you can pull a lot of heat out
of the radio in a few seconds.

6m is an interesting band. It combines elements of HF and VHF. You can ragchew on FM (although repeaters on this band are not as numerous as on 2m or 440). You can also chase DX like crazy - even at the bottom of the sunspot cycle. For example, during May and June of this year 6m saw some fantastic sporadic E layer propagation that had the east coast working Europe, the west coast working Hawaii, etc. For Es openings you can work 'em with 10 watts into a vertical.

When the sunspot cycle picks up the MUF will often rise above 50 MHz allowing for DX openings just like you see on the HF bands.

If you can afford the extra couple of hundred dollars by all means pick up the TS-690. 6m can be a lot of fun.

I think this may help on transmitting, but the original post was concerning receiver performance. There can be absolutely no difference in a well designed receiver's performance. It is not necessary to run more than 12 volts on the receiver.

OTOH, the higher voltage will help a bit on transmitting in some cases.Better devices are available.

>if and how it can TX.
>Thanks, Jeff

Hi Jeff,

I recently purchased a HTX-212 and I am quite happy with it's
performance. The front end is relativly tight, it does a pretty good
job with intermod rejection. Since the rig has both CTCSS decode and
encode any intermod isn't a problem anyways. The controls are similar
to other comparable rigs. The mic also has buttons for the most common
functions. You are able to enter a frequency from the DTMF pad in VFO
or a memory location when your in that mode. Nobody has had any
negative comments about the transmitt quality.

There is a review in the July issue of 73 Amateur Radio Today. If you
get the oportunity, check it out.

At this point I have not seen any mods for tx up to 174 Mhz. I would
be interested to find out about any myself. If the 212 is anything
like it's ht "little brother" the 202 we might be out of luck.

Gary,

I bought a DSP-59+ a few weeks ago and have been very pleased with it.
It does a great job on both CW and SSB, and the noise reduction works
very well. You can hear your sidetone; just set the center frequency
to your sidetone frequency.

QST didn't actually pan it for its noise, IMHO. Their review mentioned
that you could hear some noise if you cranked the gain way up in the
absence of a signal. The unit's noise is not noticeable at all in
normal operation. I can hear a little bit of noise if I crank it all
the way up with no signal input, but its noise is inaudible if I
feed it audio from the receiver, even with the RF gain all the way down.

I'm not very impressed with most MFJ stuff, and from what I've heard,
their DSP probably leaves much to be desired in both performance and
workmanship. Just my $0.02 worth on Mighty Fine Junk.

Actually there are some advantages to the internal supply approach,
but you're right, Tom - it has nothing to do with the location of the
supply. Some of the internal supplies run significantly more than
12-15 volts, and this can be an advantage in some cases. Better IMD
and spectral purity from the PA are easier to achieve at the higher
voltages (28 to 30 volts) that these internal supplies offer. It's
also easier to make a 200 watt PA when it runs on 28v, which is why
the 200w output rigs generally have internal power supplies.

>standing waves on the feedline and that when you turn up the power
>some of that voltages gets back into the rig and confuses the display.

A resonant antenna can indeed need a transmatch. All resonance means
is that there's no net reactive component at the feedpoint. The
resistive component could be anything, depending on the particular
antenna geometry, and may need a transmatch to transform that impedance
to 50 ohms. In the case of a G5RV, it's longer than a halfwave
on 20 meters, 3/2-waves in fact. The feedpoint impedance should be
moderate, somewhere not too far from 50 ohms, but the G5RV is fed
with a 300 ohm balanced line section terminated into a coax. You're
not going to get 1:1 SWR on that balanced line (and probably not
on the coax either).

The fact that the line has SWR, however, has nothing to do with
RF in the shack. That's a balance problem, not a matching problem.
SWR on the line just means there are circulating differential
currents *inside* the line that form a standing wave pattern.
They can't get *out* of the line to cause a hot chassis unless

there is a system imbalance and parallel currents are flowing
on the *outside* of the coax. (From the point of view of currents
flowing inside coax, it is a balanced line. It's only for currents
flowing on the outside of the coax that imbalance is an issue.)

There are two kinds of balance involved here, physical and electrical.
Physical balance is important because the induction field can induce
a common mode current on the coax shield. Electrical balance is important
because it can upset the differential current balance of the feedline.

Physical balance is a matter of laying out the antenna and feedline
in a symmetrical manner, IE both legs of the antenna need to be mirror
images of each other with respect to themselves and to Earth, and the
feedline should be routed to bisect that symmetry.

Electrical symmetry is pretty much automatic if physical symmetry is
followed with regard to the antenna and the balanced line section.
The point where the coax attaches, however, can create an electrical
imbalance because shield currents can flow on both the inside and
outside of the shield at this connection point. This creates an
imbalance with respect to the currents flowing in the inner conductor.
A choke balun here (6 to 8 tight turns of the coax will do) will
restore the balance by stopping currents from flowing on the outside
of the shield.

>You might be able to make a virtual ground by attaching a 1/4
>wavelength (at operating frequency) piece of wire to the rig and just
>run it along the baseboard of the shack.

This may treat the *symptom*, but it doesn't address the cause.
A bilaterally symmetric antenna does not need a ground, virtual
or real, in order to perform properly. It's usually wise to
treat the brain tumor rather than just taking aspirn to suppress
the pain. Reserve grounds, virtual or otherwise, for feeding
asymmetric antennas like longwires. *They* need that current
mirror to replace the other half of their symmetry. If you
try to compensate for a hot shield with a balance wire, you
are still screwing up the antenna's design radiation pattern
since the feedline is now part of the radiating structure.

Subject: 572B tube in Collins 30L1 ???

Doug,

572B will work just fine in a 30L-1. You won't get anymore
power out but they will last forever. Collins recommends that
you change out one of the one of the caps in the 30L-1 for
best operation with a 572B but I've tried them with a stock
unit and it seemed to work fine. If your really interested in

this mod I can dig through my stuff and tell you which cap to change.

As far as the ceramic based 811A, I've used bakelite 811 and 811A tubes for years and have never found any problems. I wouldn't spend any extra for a ceramic base but if its the same price, why not!

From: nepaleduc@aol.com (Nepal educ)
Subject: 800 MHz mod - C508A

Hi,

I have noted that my C508A picks up cellular conversations on the image frequency. The C508A first IF is 23.05 MHz, so my guess is that the images will be 46.1 MHz higher than the 870-890 MHz cell site outputs, ie 916.1MHz to 936.1 MHz. Set the frequency offset to 30 KHz and snoop away!

The image sensitivity is of course not good - I live on a hill and the S meter doesn't go to S9, but it seems better than having a mods butcher pulling such an intricate package apart!

the ones I know about:

IC-2GXAT mods:
1) Extended rx (136-180 Mhz): Hold down F-Scan-Duplex keys at same time
and turn radio ON. Or, cut diode D13 on logic unit.
2) Extended tx. Cut diode D14 on logic unit.
I have done the keypad mod for extended rx and it works without any mishap
to the radio. 73/Terry VE4UC

Subject: what's mods for Icom 260E ?

If this radio is similiar to my old IC-255A one of the pins on the mike connector if grounded will start the VCO incrementing and a 1K ohm resistor across the pin to ground will start the VCO decrementing, or visa versa. Hope this helps.

: Steve, are you sure the battery power is dropping off or is it the
: radio that is reducing the transmit power output? I believe the user
: manual states that when you use a high power batter pack or DC
: adapter, the radio may overheat from the higher power output and when
: it overheats, it automatically reduces its output power level. I have
: never had mine get hot enough to completely quit transmitting, but it
: sounds like that might be your problem. I hope this helps...73's
: Floyd WD5ENJ

I'll add my two-cents worth here. You are both partially right.
I have had my FT51R heat up enough to shift to low power and then
to stop transmitting. You will notice that it is in low power
because the transmit scale will be half or a quarter of what it
would be in full power. When it finally overheats, it will actually
stop transmitting. That is your red transmit light will switch
to green even though you have the PTT pressed.

Unfortunately, except for the blisters on your palms, the transition
to low power and then no power associated with over heating is
indistinguishable from the same transitions you would see if you
were on low battery.

To answer the original question, my understanding is that the EDC-12
is a trickle charge, but that it does not bypass the battery, so you
can at high power draw more current from the battery than it is putting
in. I use the bulkier PA-10A, which does give you full power bypass
and trickle charge.

I hope that helps, and by the way, has anyone come up with a heat sync
for this radio? I have a couple of drawings, but I don't know what
material to use. Currently, I have had some sucess wrapping an ice
cube in a paper towel, and rubbing along the back of the radio. This
works best if you remove the belt clip and use a speaker mike. I know
that this is unworkable for most folks, but it does work in a pinch.
As long as you keep the radio dry, you can pull a lot of heat out
of the radio in a few seconds.

Overloads easily, and has a terrible noise figure. Mutek (England)
has a replacement front end board that will fix this radio. I've
used it in a IC211, and it does wonders for strong signal handling
and for reducing the system noise figure.

The question is: Are there any radios that can do 2m FM and High Band commercial?

The Bendix/King and other were mentioned. Add to this the Motorola Saber handheld.These can be found on the used market. It helps if you have a source inside of Motorola. If you want a mobile try a Motorola Syntor, and if you what complete frequency agility as opposed to a prom-bound radio you need to get yourself an Anaconda control head for the Sytor, I don't have the address handy but I will post it later.

You did not say how large a battery you wanted, which would help.
Assuming you are in the market for something other than palm sized you
should try Sears. They have a range of gell cells at attractive prices
available on special order from their auto centers. At least that's
what the flyer they were handing out at the last Miami Boat Show
indicated. Failing Sears, try West Marine or Boat/US. The 800
information operator can give you their numbers.

Well Ed,
Out of 5 rigs (TS-440's) we bought, all five failed with the VCO glue. I fixed my own, the rest sent them in for repair. One has been repaired in other ways, but that's because N1JWR won't take the time to get his 13 W/M!!! And so the rig languishes, waiting for a warm hand to carress... but I digress...

My Kenwood 741 has stopped transmitting on the 6 meter module, and now the 2 meter module...

My guess is... they just arn't all that well designed, just adequate for the dainty ham operator. (I'm a HAM fisted 24 hour user...)

On the other hand, NOTHING I've ever owned didn't at one time or another need fixin. Ask me about the ICOM W2A...

I have recently introduced a number of students, by way of a short class, to amateur radio. The response by them was very positive and I have made one of my goals for this next semester to get a station going for them at the school. Equipment donation of any sort would be very helpful.

The school is called the Challenge School and is a charter school for the Cherry Creek School district located in southeast Aurora, Colorado. It emphasizes education in the sciences and a station would fit right in with not only their curriculum but the interest expressed by many students I have spoken with. The grades of focus are 3rd to 8th, with middle school grades (6,7,8) being where the most interest has been.

For myself, this is a first experience, and am very much looking forward to following thru on this if I can get the needed gear. Unfortunately, there is not any current funding for it so donations is the way to go.

If you have any donations, I will provide you with a receipt clearly indicating the schools appreciation and the approximate value if you would like for tax deductibility. Please enclose the estimated value of the equipment if you have any idea. This station is starting from zero, so anything would be great and we are very much hoping someone has a tranceiver which they would like to pass along to a very curious bunch of kids!

Thanx much,

Rich Scheuerer, K0ZX aka rfs@usa.net

Gary,

I bought a DSP-59+ a few weeks ago and have been very pleased with it.
It does a great job on both CW and SSB, and the noise reduction works
very well. You can hear your sidetone; just set the center frequency
to your sidetone frequency.

QST didn't actually pan it for its noise, IMHO. Their review mentioned
that you could hear some noise if you cranked the gain way up in the
absence of a signal. The unit's noise is not noticeable at all in
normal operation. I can hear a little bit of noise if I crank it all
the way up with no signal input, but its noise is inaudible if I
feed it audio from the receiver, even with the RF gain all the way down.

I'm not very impressed with most MFJ stuff, and from what I've heard,
their DSP probably leaves much to be desired in both performance and
workmanship. Just my $0.02 worth on Mighty Fine Junk.

>I can think of threads of logic that may be distorted into forming that
>conclusion, but it is a giant leap.

Actually there are some advantages to the internal supply approach,
but you're right, Tom - it has nothing to do with the location of the
supply. Some of the internal supplies run significantly more than
12-15 volts, and this can be an advantage in some cases. Better IMD
and spectral purity from the PA are easier to achieve at the higher
voltages (28 to 30 volts) that these internal supplies offer. It's
also easier to make a 200 watt PA when it runs on 28v, which is why
the 200w output rigs generally have internal power supplies.

A resonant antenna can indeed need a transmatch. All resonance means
is that there's no net reactive component at the feedpoint. The
resistive component could be anything, depending on the particular
antenna geometry, and may need a transmatch to transform that impedance
to 50 ohms. In the case of a G5RV, it's longer than a halfwave
on 20 meters, 3/2-waves in fact. The feedpoint impedance should be
moderate, somewhere not too far from 50 ohms, but the G5RV is fed

with a 300 ohm balanced line section terminated into a coax. You're
not going to get 1:1 SWR on that balanced line (and probably not
on the coax either).

The fact that the line has SWR, however, has nothing to do with
RF in the shack. That's a balance problem, not a matching problem.
SWR on the line just means there are circulating differential
currents *inside* the line that form a standing wave pattern.
They can't get *out* of the line to cause a hot chassis unless
there is a system imbalance and parallel currents are flowing
on the *outside* of the coax. (From the point of view of currents
flowing inside coax, it is a balanced line. It's only for currents
flowing on the outside of the coax that imbalance is an issue.)

There are two kinds of balance involved here, physical and electrical.
Physical balance is important because the induction field can induce
a common mode current on the coax shield. Electrical balance is important
because it can upset the differential current balance of the feedline.

Physical balance is a matter of laying out the antenna and feedline
in a symmetrical manner, IE both legs of the antenna need to be mirror
images of each other with respect to themselves and to Earth, and the
feedline should be routed to bisect that symmetry.

Electrical symmetry is pretty much automatic if physical symmetry is
followed with regard to the antenna and the balanced line section.
The point where the coax attaches, however, can create an electrical
imbalance because shield currents can flow on both the inside and
outside of the shield at this connection point. This creates an
imbalance with respect to the currents flowing in the inner conductor.
A choke balun here (6 to 8 tight turns of the coax will do) will
restore the balance by stopping currents from flowing on the outside
of the shield.

>You might be able to make a virtual ground by attaching a 1/4
>wavelength (at operating frequency) piece of wire to the rig and just
>run it along the baseboard of the shack.

This may treat the *symptom*, but it doesn't address the cause.
A bilaterally symmetric antenna does not need a ground, virtual
or real, in order to perform properly. It's usually wise to
treat the brain tumor rather than just taking aspirn to suppress
the pain. Reserve grounds, virtual or otherwise, for feeding
asymmetric antennas like longwires. *They* need that current
mirror to replace the other half of their symmetry. If you
try to compensate for a hot shield with a balance wire, you
are still screwing up the antenna's design radiation pattern
since the feedline is now part of the radiating structure.

Subject: Good customer service - ICOM

I can second Gary's comments about ICOM. Right after I purchased my 820H I was attempting the expanded receive mod and slipped with the soldering iron and damaged a diode. Not only did ICOM ship the part to me at no charge, they also shipped a wiring and componet location sheet to assist me.

Gary Fiber in tech support has also been top notch for questions. He even emailed me on a Saturday about a problem I was having with a ICOM amp!

Needless to say I have purchased several ICOM unit since! Customer service is key and ICOM understands it!

Herb, That's about as good as worrying about the color of paint. The location of the supply and what it plugs into have no effect on the parameters mentioned.
I can think of threads of logic that may be distorted into forming that conclusion, but it is a giant leap.

You hear a lot of strange stuff if you listen long enough.

From: dsnowden@ccd.harris.com (Doug Snowden)
Subject: 572B tube in Collins 30L1 ???

Subject says it. Will the 572B tube fit in the 30L1? Physically? It
might be a bit bigger than the 811A tube, I don't know. If it will
fit, is it electrically near the 811A? What is the result, more power?
More reliablity? Or a waste of money?

Along the same line, what is the advantage of using a ceramic based
811A as opposed to the bakelite based ones? I see RF parts advertise
the ceramic based ones at quite a bit more money..

Subject: 572B tube in Collins 30L1 ???

Doug,

572B will work just fine in a 30L-1. You won't get anymore power out but they will last forever. Collins recommends that you change out one of the one of the caps in the 30L-1 for best operation with a 572B but I've tried them with a stock unit and it seemed to work fine. If your really interested in this mod I can dig through my stuff and tell you which cap to change.

As far as the ceramic based 811A, I've used bakelite 811 and 811A tubes for years and have never found any problems. I wouldn't spend any extra for a ceramic base but if its the same price, why not!

From: nepaleduc@aol.com (Nepal educ)
Subject: 800 MHz mod - C508A

Hi,

I have noted that my C508A picks up cellular conversations on the image frequency. The C508A first IF is 23.05 MHz, so my guess is that the images will be 46.1 MHz higher than the 870-890 MHz cell site outputs, ie 916.1MHz to 936.1 MHz. Set the frequency offset to 30 KHz and snoop away!

The image sensitivity is of course not good - I live on a hill and the S meter doesn't go to S9, but it seems better than having a mods butcher pulling such an intricate package apart!

Cheers,

: Steve, are you sure the battery power is dropping off or is it the
: radio that is reducing the transmit power output? I believe the user
: manual states that when you use a high power batter pack or DC
: adapter, the radio may overheat from the higher power output and when
: it overheats, it automatically reduces its output power level. I have
: never had mine get hot enough to completely quit transmitting, but it
: sounds like that might be your problem. I hope this helps...73's
: Floyd WD5ENJ

I'll add my two-cents worth here. You are both partially right.
I have had my FT51R heat up enough to shift to low power and then
to stop transmitting. You will notice that it is in low power
because the transmit scale will be half or a quarter of what it
would be in full power. When it finally overheats, it will actually
stop transmitting. That is your red transmit light will switch
to green even though you have the PTT pressed.

Unfortunately, except for the blisters on your palms, the transition
to low power and then no power associated with over heating is
indistinguishable from the same transitions you would see if you
were on low battery.

To answer the original question, my understanding is that the EDC-12
is a trickle charge, but that it does not bypass the battery, so you
can at high power draw more current from the battery than it is putting
in. I use the bulkier PA-10A, which does give you full power bypass
and trickle charge.

I hope that helps, and by the way, has anyone come up with a heat sync
for this radio? I have a couple of drawings, but I don't know what
material to use. Currently, I have had some sucess wrapping an ice
cube in a paper towel, and rubbing along the back of the radio. This
works best if you remove the belt clip and use a speaker mike. I know
that this is unworkable for most folks, but it does work in a pinch.

As long as you keep the radio dry, you can pull a lot of heat out
of the radio in a few seconds.

Overloads easily, and has a terrible noise figure. Mutek (England)
has a replacement front end board that will fix this radio. I've
used it in a IC211, and it does wonders for strong signal handling
and for reducing the system noise figure.

Cut up an expired credit card, or better yet, some other, thinner, plastic
card. I used last years' membership card for the Seattle zoo (perhaps as
a comment on the state of 2 meters, but anyway. . .) Trim it so that it
will just slide into the metal rails at the top of the battery and cover
the contacts.

Don't use cardboard, as it will shed fibers and could gunk things up.

ICOM batteries for the 02-AT and 2-AT (same style as your HTX-202's) came
with a just such a rectangular plastic cover.

>fit, is it electrically near the 811A? What is the result, more
>power? More reliablity? Or a waste of money?

The 572B is virtually identical to the 811A but with a much greater
plate dissipation (160W VS 65W). Unfortunately, in order to make use
of that additional dissipation, you need to raise the plate

supply to about 2500V. Personally, I wouldn't spend the extra money
as replacements for the Collins.

>Along the same line, what is the advantage of using a ceramic based
>811A as opposed to the bakelite based ones? I see RF parts advertise
>the ceramic based ones at quite a bit more money..

I'm not aware of any advantages offered by the ceramis base, but maybe
there's another reason for the price difference. Wonder if the
ceramics are U.S. made?

Yes Gary, but the original question was would an internal power supply
improve the RECEIVERS dynamic range, noise floor, etc.

I sure think the correct answer to that question was NO.

>73 Tom

One reason I can think of for that being true, is that most internal
power supplies are better built by the manufacturers than a cheap
external power supply a user may use in some cases. If you use a good
quality external power supply, then the should be no difference in
reception.

Subject: FT530 programming

I have what may be a very unusual but interesting question. A few months
ago,
I encountered a lot of talk about whether memory settings could be cloned
from
one FT530 to another. I believe that the answer was yes and that it could
be
done through the 1/8" jack of the spkr/mic plug. Recently, Yaesu has come
out with the FT51R which is programmable (not just cloneable) through this
plug.
An I correct in assuming that the 51 programming software would work on the
530? What do you think?

From: dave@diusys.cms.udel.edu (Dave Dabell)
Subject: K-com filters and Telephone RFI

Yes, I've used a K-com filter on an at&t trimline-like phone (keypad in
the handset). This was a newer electronic model that had a volume level
switch for rcvd audio. It picked up rf bad enough to hear it across the
room. After installing a K-com at the handset rf could still be heard,
but it was less than 1/2 as loud as the voice at the other end of the
line. Quite a reduction.
Inside the k-com is a torroid with maybe 30 turns of small gauge wire
for each side of the line. So it appears to be just a choke. I assume
it has quite a bit more inductance than you could get by wrapping the
cord around a snap on choke.
Good luck with the rfi. If all else fails, you could always go back to
an old ma bell model. They were pretty rf-proof.

Subject: KENWOOD RELIABILITY

Well Ed,
Out of 5 rigs (TS-440's) we bought, all five failed with the VCO
glue. I fixed my own, the rest sent them in for repair. One has been
repaired in other ways, but that's because N1JWR won't take the time to
get his 13 W/M!!! And so the rig languishes, waiting for a warm hand to
carress... but I digress...

My Kenwood 741 has stopped transmitting on the 6 meter module, and now
the 2 meter module...

My guess is... they just arn't all that well designed, just adequate for
the dainty ham operator. (I'm a HAM fisted 24 hour user...)

On the other hand, NOTHING I've ever owned didn't at one time or another
need fixin. Ask me about the ICOM W2A...

Tom

Gary,

I bought a DSP-59+ a few weeks ago and have been very pleased with it.
It does a great job on both CW and SSB, and the noise reduction works
very well. You can hear your sidetone; just set the center frequency
to your sidetone frequency.

QST didn't actually pan it for its noise, IMHO. Their review mentioned
that you could hear some noise if you cranked the gain way up in the
absence of a signal. The unit's noise is not noticeable at all in
normal operation. I can hear a little bit of noise if I crank it all
the way up with no signal input, but its noise is inaudible if I
feed it audio from the receiver, even with the RF gain all the way down.

I'm not very impressed with most MFJ stuff, and from what I've heard,
their DSP probably leaves much to be desired in both performance and
workmanship. Just my $0.02 worth on Mighty Fine Junk.

Actually there are some advantages to the internal supply approach,
but you're right, Tom - it has nothing to do with the location of the
supply. Some of the internal supplies run significantly more than
12-15 volts, and this can be an advantage in some cases. Better IMD
and spectral purity from the PA are easier to achieve at the higher
voltages (28 to 30 volts) that these internal supplies offer. It's
also easier to make a 200 watt PA when it runs on 28v, which is why
the 200w output rigs generally have internal power supplies.

>resonant antenna would not need a transmatch. I suspect you have
>standing waves on the feedline and that when you turn up the power
>some of that voltages gets back into the rig and confuses the display.

A resonant antenna can indeed need a transmatch. All resonance means
is that there's no net reactive component at the feedpoint. The
resistive component could be anything, depending on the particular
antenna geometry, and may need a transmatch to transform that impedance
to 50 ohms. In the case of a G5RV, it's longer than a halfwave
on 20 meters, 3/2-waves in fact. The feedpoint impedance should be
moderate, somewhere not too far from 50 ohms, but the G5RV is fed
with a 300 ohm balanced line section terminated into a coax. You're
not going to get 1:1 SWR on that balanced line (and probably not
on the coax either).

The fact that the line has SWR, however, has nothing to do with
RF in the shack. That's a balance problem, not a matching problem.
SWR on the line just means there are circulating differential
currents *inside* the line that form a standing wave pattern.
They can't get *out* of the line to cause a hot chassis unless

there is a system imbalance and parallel currents are flowing
on the *outside* of the coax. (From the point of view of currents
flowing inside coax, it is a balanced line. It's only for currents
flowing on the outside of the coax that imbalance is an issue.)

There are two kinds of balance involved here, physical and electrical.
Physical balance is important because the induction field can induce
a common mode current on the coax shield. Electrical balance is important
because it can upset the differential current balance of the feedline.

Physical balance is a matter of laying out the antenna and feedline
in a symmetrical manner, IE both legs of the antenna need to be mirror
images of each other with respect to themselves and to Earth, and the
feedline should be routed to bisect that symmetry.

Electrical symmetry is pretty much automatic if physical symmetry is
followed with regard to the antenna and the balanced line section.
The point where the coax attaches, however, can create an electrical
imbalance because shield currents can flow on both the inside and
outside of the shield at this connection point. This creates an
imbalance with respect to the currents flowing in the inner conductor.
A choke balun here (6 to 8 tight turns of the coax will do) will
restore the balance by stopping currents from flowing on the outside
of the shield.

>You might be able to make a virtual ground by attaching a 1/4
>wavelength (at operating frequency) piece of wire to the rig and just
>run it along the baseboard of the shack.

This may treat the *symptom*, but it doesn't address the cause.
A bilaterally symmetric antenna does not need a ground, virtual
or real, in order to perform properly. It's usually wise to
treat the brain tumor rather than just taking aspirn to suppress
the pain. Reserve grounds, virtual or otherwise, for feeding
asymmetric antennas like longwires. *They* need that current
mirror to replace the other half of their symmetry. If you
try to compensate for a hot shield with a balance wire, you
are still screwing up the antenna's design radiation pattern
since the feedline is now part of the radiating structure.

Herb, That's about as good as worrying about the color of paint. The location of the supply and what it plugs into have no effect on the parameters mentioned.
I can think of threads of logic that may be distorted into forming that conclusion, but it is a giant leap.

You hear a lot of strange stuff if you listen long enough.

From: dsnowden@ccd.harris.com (Doug Snowden)
Subject: 572B tube in Collins 30L1 ???

Subject says it. Will the 572B tube fit in the 30L1? Physically? It
might be a bit bigger than the 811A tube, I don't know. If it will
fit, is it electrically near the 811A? What is the result, more power?
More reliablity? Or a waste of money?

Along the same line, what is the advantage of using a ceramic based
811A as opposed to the bakelite based ones? I see RF parts advertise
the ceramic based ones at quite a bit more money..

Subject: 572B tube in Collins 30L1 ???

Doug,

572B will work just fine in a 30L-1. You won't get anymore
power out but they will last forever. Collins recommends that
you change out one of the one of the caps in the 30L-1 for
best operation with a 572B but I've tried them with a stock
unit and it seemed to work fine. If your really interested in

this mod I can dig through my stuff and tell you which cap to change.

As far as the ceramic based 811A, I've used bakelite 811 and 811A tubes for years and have never found any problems. I wouldn't spend any extra for a ceramic base but if its the same price, why not!

From: nepaleduc@aol.com (Nepal educ)
Subject: 800 MHz mod - C508A

Hi,

I have noted that my C508A picks up cellular conversations on the image frequency. The C508A first IF is 23.05 MHz, so my guess is that the images will be 46.1 MHz higher than the 870-890 MHz cell site outputs, ie 916.1MHz to 936.1 MHz. Set the frequency offset to 30 KHz and snoop away!

The image sensitivity is of course not good - I live on a hill and the S meter doesn't go to S9, but it seems better than having a mods butcher pulling such an intricate package apart!

Cheers,

: never had mine get hot enough to completely quit transmitting, but it
: sounds like that might be your problem. I hope this helps...73's
: Floyd WD5ENJ

I'll add my two-cents worth here. You are both partially right.
I have had my FT51R heat up enough to shift to low power and then
to stop transmitting. You will notice that it is in low power
because the transmit scale will be half or a quarter of what it
would be in full power. When it finally overheats, it will actually
stop transmitting. That is your red transmit light will switch
to green even though you have the PTT pressed.

Unfortunately, except for the blisters on your palms, the transition
to low power and then no power associated with over heating is
indistinguishable from the same transitions you would see if you
were on low battery.

To answer the original question, my understanding is that the EDC-12
is a trickle charge, but that it does not bypass the battery, so you
can at high power draw more current from the battery than it is putting
in. I use the bulkier PA-10A, which does give you full power bypass
and trickle charge.

I hope that helps, and by the way, has anyone come up with a heat sync
for this radio? I have a couple of drawings, but I don't know what
material to use. Currently, I have had some sucess wrapping an ice
cube in a paper towel, and rubbing along the back of the radio. This
works best if you remove the belt clip and use a speaker mike. I know
that this is unworkable for most folks, but it does work in a pinch.
As long as you keep the radio dry, you can pull a lot of heat out
of the radio in a few seconds.

Overloads easily, and has a terrible noise figure. Mutek (England)
has a replacement front end board that will fix this radio. I've
used it in a IC211, and it does wonders for strong signal handling
and for reducing the system noise figure.

You did not say how large a battery you wanted, which would help.
Assuming you are in the market for something other than palm sized you
should try Sears. They have a range of gell cells at attractive prices
available on special order from their auto centers. At least that's
what the flyer they were handing out at the last Miami Boat Show
indicated. Failing Sears, try West Marine or Boat/US. The 800
information operator can give you their numbers.

Subject: WTB: Tone pad TR-7600 (Kenwood)

I am looking for the tone pad for the Kenwood TR-7600. The unit plugs
in the back into a 3 or 4 pin socket. If you have one of these lying
around, or know how I might wire one up, please send me email.

PS I know that I can go to Radio Shack and pick up a audio tone pad
that I could use into the mic, but I would rather have a plug in unit
if possible.

Thanks .

Subject: Yaesu FT51R

I bought one a couple of weeks ago. I haven't talked much on it, but I
have used it several times in a QSO with a friend on a repeater. On full
5 watts, it seems like it will be useable for at least twenty minutes of
back and forth talking. On the next lower power (3.5 watts, I think) it
seemed like we could just keep talking into the night. The back got a
little warm, but evidently not warm enough to do anything during the 1.5
to 2 hours I was using it.

: YAESU USA

Kevin,
My experience (and that of atleast one other FT-51R user here in Atlanta)
is that the radio is too hot to hold after as little as 15 minutes of
back and forth at full power using the PA-10A. Recently, I was in the
car and the radio started reducing power after about 20 minutes.
Can you suggest a heatsink for this radio. I love the RT Systems software,
but I hate having to wear an oven mitt to QSO.

Curt,

Wow, what a memory, yes I'm the same Les Butler who filmed the crash and
wrote the article for Monitoring Times last summer. I can't believe
someone remembered.
Anyway after programming the radio via P.C. with R.T. Systems software
the receive range is 66 to 999 Mhz. Actually the sensistivity is pretty
poor at the extreme ends but I have programmed in L.A.P.D. when I visit
L.A. and it works very well in the 480 to 506. The 800 and 900 areas are
virtually deaf, it may be that the board for that range isn't even in the
radio, I don't know. I haven't tried FM music stations yet either. You
must program the radio via P.C. to extend it's range, entering via the
keypad will not work. It's well worth the $40 they ask for it. I've been
using mine since it's introduction in April at the Dayton Hamfest.

>power? More reliablity? Or a waste of money?

The 572B is virtually identical to the 811A but with a much greater
plate dissipation (160W VS 65W). Unfortunately, in order to make use
of that additional dissipation, you need to raise the plate
supply to about 2500V. Personally, I wouldn't spend the extra money
as replacements for the Collins.

>Along the same line, what is the advantage of using a ceramic based
>811A as opposed to the bakelite based ones? I see RF parts advertise
>the ceramic based ones at quite a bit more money..

I'm not aware of any advantages offered by the ceramis base, but maybe
there's another reason for the price difference. Wonder if the
ceramics are U.S. made?

Yes Gary, but the original question was would an internal power supply
improve the RECEIVERS dynamic range, noise floor, etc.

I sure think the correct answer to that question was NO.

>73 Tom

One reason I can think of for that being true, is that most internal
power supplies are better built by the manufacturers than a cheap
external power supply a user may use in some cases. If you use a good
quality external power supply, then the should be no difference in
reception.

From: dave@diusys.cms.udel.edu (Dave Dabell)
Subject: K-com filters and Telephone RFI

Yes, I've used a K-com filter on an at&t trimline-like phone (keypad in
the handset). This was a newer electronic model that had a volume level
switch for rcvd audio. It picked up rf bad enough to hear it across the
room. After installing a K-com at the handset rf could still be heard,
but it was less than 1/2 as loud as the voice at the other end of the
line. Quite a reduction.
Inside the k-com is a torroid with maybe 30 turns of small gauge wire
for each side of the line. So it appears to be just a choke. I assume
it has quite a bit more inductance than you could get by wrapping the
cord around a snap on choke.
Good luck with the rfi. If all else fails, you could always go back to
an old ma bell model. They were pretty rf-proof.

Subject: KENWOOD RELIABILITY

Well Ed,
Out of 5 rigs (TS-440's) we bought, all five failed with the VCO
glue. I fixed my own, the rest sent them in for repair. One has been
repaired in other ways, but that's because N1JWR won't take the time to
get his 13 W/M!!! And so the rig languishes, waiting for a warm hand to
carress... but I digress...

My Kenwood 741 has stopped transmitting on the 6 meter module, and now
the 2 meter module...

My guess is... they just arn't all that well designed, just adequate for
the dainty ham operator. (I'm a HAM fisted 24 hour user...)

On the other hand, NOTHING I've ever owned didn't at one time or another
need fixin. Ask me about the ICOM W2A...

Tom

From: stephen.king@kandy.com (STEPHEN KING)
Subject: Midland CB

I know this is a HAM conference, but thought that there may be those
that started with CB and/or have used CB.

I recently found a Midland CB transceiver in my garage. It is model
77-112. I have looked everywhere but can't find any paper work for it.
If anyone has the user manual and/or installation manual for this CB
please contact me via e-mail.

stephen.king@kandy.com

Thanks

Gary,

I bought a DSP-59+ a few weeks ago and have been very pleased with it.
It does a great job on both CW and SSB, and the noise reduction works
very well. You can hear your sidetone; just set the center frequency

to your sidetone frequency.

QST didn't actually pan it for its noise, IMHO. Their review mentioned
that you could hear some noise if you cranked the gain way up in the
absence of a signal. The unit's noise is not noticeable at all in
normal operation. I can hear a little bit of noise if I crank it all
the way up with no signal input, but its noise is inaudible if I
feed it audio from the receiver, even with the RF gain all the way down.

I'm not very impressed with most MFJ stuff, and from what I've heard,
their DSP probably leaves much to be desired in both performance and
workmanship. Just my $0.02 worth on Mighty Fine Junk.

Actually there are some advantages to the internal supply approach,
but you're right, Tom - it has nothing to do with the location of the
supply. Some of the internal supplies run significantly more than
12-15 volts, and this can be an advantage in some cases. Better IMD
and spectral purity from the PA are easier to achieve at the higher
voltages (28 to 30 volts) that these internal supplies offer. It's
also easier to make a 200 watt PA when it runs on 28v, which is why
the 200w output rigs generally have internal power supplies.

>standing waves on the feedline and that when you turn up the power
>some of that voltages gets back into the rig and confuses the display.

A resonant antenna can indeed need a transmatch. All resonance means
is that there's no net reactive component at the feedpoint. The
resistive component could be anything, depending on the particular
antenna geometry, and may need a transmatch to transform that impedance
to 50 ohms. In the case of a G5RV, it's longer than a halfwave
on 20 meters, 3/2-waves in fact. The feedpoint impedance should be
moderate, somewhere not too far from 50 ohms, but the G5RV is fed
with a 300 ohm balanced line section terminated into a coax. You're
not going to get 1:1 SWR on that balanced line (and probably not
on the coax either).

The fact that the line has SWR, however, has nothing to do with
RF in the shack. That's a balance problem, not a matching problem.
SWR on the line just means there are circulating differential
currents *inside* the line that form a standing wave pattern.
They can't get *out* of the line to cause a hot chassis unless
there is a system imbalance and parallel currents are flowing
on the *outside* of the coax. (From the point of view of currents
flowing inside coax, it is a balanced line. It's only for currents
flowing on the outside of the coax that imbalance is an issue.)

There are two kinds of balance involved here, physical and electrical.
Physical balance is important because the induction field can induce
a common mode current on the coax shield. Electrical balance is important
because it can upset the differential current balance of the feedline.

Physical balance is a matter of laying out the antenna and feedline
in a symmetrical manner, IE both legs of the antenna need to be mirror
images of each other with respect to themselves and to Earth, and the
feedline should be routed to bisect that symmetry.

Electrical symmetry is pretty much automatic if physical symmetry is
followed with regard to the antenna and the balanced line section.
The point where the coax attaches, however, can create an electrical
imbalance because shield currents can flow on both the inside and
outside of the shield at this connection point. This creates an
imbalance with respect to the currents flowing in the inner conductor.
A choke balun here (6 to 8 tight turns of the coax will do) will
restore the balance by stopping currents from flowing on the outside
of the shield.

>You might be able to make a virtual ground by attaching a 1/4
>wavelength (at operating frequency) piece of wire to the rig and just
>run it along the baseboard of the shack.

This may treat the *symptom*, but it doesn't address the cause.
A bilaterally symmetric antenna does not need a ground, virtual
or real, in order to perform properly. It's usually wise to
treat the brain tumor rather than just taking aspirn to suppress
the pain. Reserve grounds, virtual or otherwise, for feeding
asymmetric antennas like longwires. *They* need that current
mirror to replace the other half of their symmetry. If you
try to compensate for a hot shield with a balance wire, you
are still screwing up the antenna's design radiation pattern
since the feedline is now part of the radiating structure.

Subject: 572B tube in Collins 30L1 ???

Doug,

572B will work just fine in a 30L-1. You won't get anymore power out but they will last forever. Collins recommends that you change out one of the one of the caps in the 30L-1 for best operation with a 572B but I've tried them with a stock unit and it seemed to work fine. If your really interested in this mod I can dig through my stuff and tell you which cap to change.

As far as the ceramic based 811A, I've used bakelite 811 and 811A tubes for years and have never found any problems. I wouldn't spend any extra for a ceramic base but if its the same price, why not!

From: nepaleduc@aol.com (Nepal educ)
Subject: 800 MHz mod - C508A

Hi,

I have noted that my C508A picks up cellular conversations on the image frequency. The C508A first IF is 23.05 MHz, so my guess is that the images will be 46.1 MHz higher than the 870-890 MHz cell site outputs, ie 916.1MHz to 936.1 MHz. Set the frequency offset to 30 KHz and snoop away!

The image sensitivity is of course not good - I live on a hill and the S meter doesn't go to S9, but it seems better than having a mods butcher pulling such an intricate package apart!

Subject: Need info on Kenwood TS 850 (converter functions)

I own a Kenwood TS 850s. Functions 26, 27 and 28 allow a 50 MHz, 144 MHZ
and
430 MHz converter to be turned on or off. Can anyone tell me if there is
a
converter that I can buy (where can I get it?) for the rig? The manual
makes
no mention of this, with the exception of saying it can be turned on or
off.

Thanks
Bob

Subject: Someone wanted IC-2GXAT mods

Somebody was looking for mods for the IC-2GXAT about 2 weeks ago. Here are the ones I know about:

IC-2GXAT mods:
1) Extended rx (136-180 Mhz): Hold down F-Scan-Duplex keys at same time and turn radio ON. Or, cut diode D13 on logic unit.
2) Extended tx. Cut diode D14 on logic unit.
I have done the keypad mod for extended rx and it works without any mishap to the radio. 73/Terry VE4UC

: Steve, are you sure the battery power is dropping off or is it the
: radio that is reducing the transmit power output? I believe the user
: manual states that when you use a high power batter pack or DC
: adapter, the radio may overheat from the higher power output and when
: it overheats, it automatically reduces its output power level. I have
: never had mine get hot enough to completely quit transmitting, but it
: sounds like that might be your problem. I hope this helps...73's
: Floyd WD5ENJ

I'll add my two-cents worth here. You are both partially right.
I have had my FT51R heat up enough to shift to low power and then

to stop transmitting. You will notice that it is in low power
because the transmit scale will be half or a quarter of what it
would be in full power. When it finally overheats, it will actually
stop transmitting. That is your red transmit light will switch
to green even though you have the PTT pressed.

Unfortunately, except for the blisters on your palms, the transition
to low power and then no power associated with over heating is
indistinguishable from the same transitions you would see if you
were on low battery.

To answer the original question, my understanding is that the EDC-12
is a trickle charge, but that it does not bypass the battery, so you
can at high power draw more current from the battery than it is putting
in. I use the bulkier PA-10A, which does give you full power bypass
and trickle charge.

I hope that helps, and by the way, has anyone come up with a heat sync
for this radio? I have a couple of drawings, but I don't know what
material to use. Currently, I have had some sucess wrapping an ice
cube in a paper towel, and rubbing along the back of the radio. This
works best if you remove the belt clip and use a speaker mike. I know
that this is unworkable for most folks, but it does work in a pinch.
As long as you keep the radio dry, you can pull a lot of heat out
of the radio in a few seconds.

Overloads easily, and has a terrible noise figure. Mutek (England)
has a replacement front end board that will fix this radio. I've
used it in a IC211, and it does wonders for strong signal handling
and for reducing the system noise figure.

You did not say how large a battery you wanted, which would help.
Assuming you are in the market for something other than palm sized you
should try Sears. They have a range of gell cells at attractive prices
available on special order from their auto centers. At least that's
what the flyer they were handing out at the last Miami Boat Show

indicated. Failing Sears, try West Marine or Boat/US. The 800
information operator can give you their numbers.

Subject: Yaesu FT51R

I bought one a couple of weeks ago. I haven't talked much on it, but I have used it several times in a QSO with a friend on a repeater. On full 5 watts, it seems like it will be useable for at least twenty minutes of back and forth talking. On the next lower power (3.5 watts, I think) it seemed like we could just keep talking into the night. The back got a little warm, but evidently not warm enough to do anything during the 1.5 to 2 hours I was using it.

Hi Victor,

My first thoughts are: Check to output and make sure your friends radio
is not putting out more than 5 watts..... Also if the temp in the Car
is really hot, the radio will reduce power earlier.

FYI and 73's

Kevin, WD6DIH

>
>OTOH, the higher voltage will help a bit on transmitting in some
>cases.Better devices are available.

To answer the referenced quote first, if you look at the internal
supplies of Japanese equipment, they aren't as good as the typical
Astron, so we can put that to bed. Answering Tom, a higher voltage
device *can* improve receiver IMD, examples include homebrew front
ends built using CATV trunk line amplifier transistors that operate
off of 48 volts. However, none of the Japanese manufacturers do
that either, so again the point is moot.

Now top of the line Japanese transceivers generally do include
an internal power supply as well as an internal antenna tuner,
but that's because they are bells and whistles, kitchen sink,
radios, not because including those things inside the basic
radio case increases receiver performance per se.

>cigarette lighter plug I could use them on my HT. What type of
>power supply (i.e. voltage and output amperage) should I use
>for these batteries?

I assume you're asking what sort of battery charger to use with these batteries. NiCads require a *constant current* charger. For best results, you want to charge at 0.1C (C is the rated amp-hour capacity of the battery). So for your batteries, you want a charger that will output a constant current of 140 ma. That will typically require an open circuit voltage of 18 volts or higher from the charger. You can build a constant current charger using one of the 3-terminal regulator devices configured for constant current use following a DC supply of 18 volts or greater.

When the battery reaches discharge (a open circuit voltage of no less than 10 volts), charge it for 14 hours at the 0.1C rate to achieve full charge (you have to put more than its rated amp-hours into it because a battery is less than 100% efficient). Remove it from the charger at that point, do not *overcharge*. That's the number one cause of battery life problems.

>I had one about 12 years ago. They are a good radio. Ham band only. Not
>many features. I sure would NOT pay $500 for one today.

Ditto, that's too much for a 730. It's worth about $300. It's not a
bad radio, but like its siblings, it overloaded easily in the presence
of strong signals. This radio is in the same family as the 720 and 740,
not the same family as the 735 (which is a newer generation design that
in turn isn't related to the 745 which *is* related (distantly) to the
730). Icom's inscrutable numbering system makes *no* sense at all.

>I am ready to become a radio brodcaster, but I have no idea what I need.

You might start with about $125,000. That'll get you a small market
Standard Broadcast license. Beyond that, another half mill will
acquire the land for the towers and equip a nice broadcast plant.
Alternately, if you're willing to assume quite a bit of existing
debt, an investment of $150,000 to $250,000 can get you an existing,
struggling, small market FM facility.

If you're in a larger market, well good luck, but prepare to spend
between $5 and $25 million for a broadcast outlet. Your best bet
is to enlist the services of a broker. There are ads in the back
of _Broadcasting_ magazine listing brokers who can aid you in
acquiring either an existing property or guide you through the
process of acquiring a new broadcast allocation. Figure on spending
at least a couple of years wading through the paperwork jungle.

You didn't think broadcasting was allowed on *amateur* radio did you?

>[with the radio OFF]!

Alas, toast. Just how long did you leave them on charge? If you
leave any NiCad on low charge for a long time, they'll grow
dendrites that short the cells, poof, there goes capacity and
life. Both of you are describing the classic symptom of batteries
that have been excessively overcharged. You could zap the *individual*
cells, and maybe get capacity back for a while, but the "fix" likely
won't last long. Once they start growing dendrites, they just keep
doing it. It's new battery time guys, and don't overcharge the next
set.

Yuck, that sucks! Sounds like the radio is running excessive crystal
current. Have you measured it? And are the crystals you installed rated
for the current drawn by this oscillator circuit? If you can't get
crystals rated to handle the current, you'll have to do a bit of redesign.
Typically, you don't want small crystals to draw more than a couple of mils
of RF current. An alternative may be to leave the oscillator always running
and key a later stage.

This *may* be a voltage switching problem, however. Have you scoped
the osc B+ rail during turn on? If the osc B+ voltage is ramping up
slow, that can cause the oscillator to be off frequency too. The cure
here is typically to reduce the size of the B+ decouplers.

Subject: Does anyone know of where I can get a battery cover plate for HTX-202

I would like a battery connection cover plate for my HTX-202 because when I
operate from external power I'm supposed to take the battery pack off but that
leaves the battery connectors to possibly get damaged, any ideas?

You're learning. :-)

However, don't be so dogmatic, Kenwood may (insert miraculous intervention
of the Virgin here) get their act together with VHF/UHF rigs one day.
Remember, it wasn't that long ago when Yaesu couldn't build a HF rig,
now they're the top dog in that department. Changes can happen, so
keep your options open.

>power? More reliablity? Or a waste of money?

The 572B is virtually identical to the 811A but with a much greater
plate dissipation (160W VS 65W). Unfortunately, in order to make use
of that additional dissipation, you need to raise the plate
supply to about 2500V. Personally, I wouldn't spend the extra money
as replacements for the Collins.

>Along the same line, what is the advantage of using a ceramic based
>811A as opposed to the bakelite based ones? I see RF parts advertise
>the ceramic based ones at quite a bit more money..

I'm not aware of any advantages offered by the ceramis base, but maybe
there's another reason for the price difference. Wonder if the
ceramics are U.S. made?

Yes Gary, but the original question was would an internal power supply
improve the RECEIVERS dynamic range, noise floor, etc.

I sure think the correct answer to that question was NO.

One reason I can think of for that being true, is that most internal
power supplies are better built by the manufacturers than a cheap
external power supply a user may use in some cases. If you use a good
quality external power supply, then the should be no difference in
reception.

Subject: FT530 programming

I have what may be a very unusual but interesting question. A few months
ago,
I encountered a lot of talk about whether memory settings could be cloned
from
one FT530 to another. I believe that the answer was yes and that it could
be
done through the 1/8" jack of the spkr/mic plug. Recently, Yaesu has come
out with the FT51R which is programmable (not just cloneable) through this

plug.
An I correct in assuming that the 51 programming software would work on the
530? What do you think?

From: dave@diusys.cms.udel.edu (Dave Dabell)
Subject: K-com filters and Telephone RFI

Yes, I've used a K-com filter on an at&t trimline-like phone (keypad in
the handset). This was a newer electronic model that had a volume level
switch for rcvd audio. It picked up rf bad enough to hear it across the
room. After installing a K-com at the handset rf could still be heard,
but it was less than 1/2 as loud as the voice at the other end of the
line. Quite a reduction.
Inside the k-com is a torroid with maybe 30 turns of small gauge wire
for each side of the line. So it appears to be just a choke. I assume
it has quite a bit more inductance than you could get by wrapping the
cord around a snap on choke.
Good luck with the rfi. If all else fails, you could always go back to
an old ma bell model. They were pretty rf-proof.

Subject: KENWOOD RELIABILITY

Well Ed,
Out of 5 rigs (TS-440's) we bought, all five failed with the VCO glue. I fixed my own, the rest sent them in for repair. One has been repaired in other ways, but that's because N1JWR won't take the time to get his 13 W/M!!! And so the rig languishes, waiting for a warm hand to carress... but I digress...

My Kenwood 741 has stopped transmitting on the 6 meter module, and now the 2 meter module...

My guess is... they just arn't all that well designed, just adequate for the dainty ham operator. (I'm a HAM fisted 24 hour user...)

On the other hand, NOTHING I've ever owned didn't at one time or another need fixin. Ask me about the ICOM W2A...

Tom

Gary,

I bought a DSP-59+ a few weeks ago and have been very pleased with it.
It does a great job on both CW and SSB, and the noise reduction works
very well. You can hear your sidetone; just set the center frequency
to your sidetone frequency.

QST didn't actually pan it for its noise, IMHO. Their review mentioned
that you could hear some noise if you cranked the gain way up in the
absence of a signal. The unit's noise is not noticeable at all in
normal operation. I can hear a little bit of noise if I crank it all
the way up with no signal input, but its noise is inaudible if I
feed it audio from the receiver, even with the RF gain all the way down.

I'm not very impressed with most MFJ stuff, and from what I've heard,
their DSP probably leaves much to be desired in both performance and
workmanship. Just my $0.02 worth on Mighty Fine Junk.

Actually there are some advantages to the internal supply approach,
but you're right, Tom - it has nothing to do with the location of the
supply. Some of the internal supplies run significantly more than
12-15 volts, and this can be an advantage in some cases. Better IMD
and spectral purity from the PA are easier to achieve at the higher
voltages (28 to 30 volts) that these internal supplies offer. It's
also easier to make a 200 watt PA when it runs on 28v, which is why
the 200w output rigs generally have internal power supplies.

>standing waves on the feedline and that when you turn up the power
>some of that voltages gets back into the rig and confuses the display.

A resonant antenna can indeed need a transmatch. All resonance means
is that there's no net reactive component at the feedpoint. The

resistive component could be anything, depending on the particular
antenna geometry, and may need a transmatch to transform that impedance
to 50 ohms. In the case of a G5RV, it's longer than a halfwave
on 20 meters, 3/2-waves in fact. The feedpoint impedance should be
moderate, somewhere not too far from 50 ohms, but the G5RV is fed
with a 300 ohm balanced line section terminated into a coax. You're
not going to get 1:1 SWR on that balanced line (and probably not
on the coax either).

The fact that the line has SWR, however, has nothing to do with
RF in the shack. That's a balance problem, not a matching problem.
SWR on the line just means there are circulating differential
currents *inside* the line that form a standing wave pattern.
They can't get *out* of the line to cause a hot chassis unless
there is a system imbalance and parallel currents are flowing
on the *outside* of the coax. (From the point of view of currents
flowing inside coax, it is a balanced line. It's only for currents
flowing on the outside of the coax that imbalance is an issue.)

There are two kinds of balance involved here, physical and electrical.
Physical balance is important because the induction field can induce
a common mode current on the coax shield. Electrical balance is important
because it can upset the differential current balance of the feedline.

Physical balance is a matter of laying out the antenna and feedline
in a symmetrical manner, IE both legs of the antenna need to be mirror
images of each other with respect to themselves and to Earth, and the
feedline should be routed to bisect that symmetry.

Electrical symmetry is pretty much automatic if physical symmetry is
followed with regard to the antenna and the balanced line section.
The point where the coax attaches, however, can create an electrical
imbalance because shield currents can flow on both the inside and
outside of the shield at this connection point. This creates an
imbalance with respect to the currents flowing in the inner conductor.
A choke balun here (6 to 8 tight turns of the coax will do) will
restore the balance by stopping currents from flowing on the outside
of the shield.

>You might be able to make a virtual ground by attaching a 1/4
>wavelength (at operating frequency) piece of wire to the rig and just
>run it along the baseboard of the shack.

This may treat the *symptom*, but it doesn't address the cause.
A bilaterally symmetric antenna does not need a ground, virtual
or real, in order to perform properly. It's usually wise to
treat the brain tumor rather than just taking aspirn to suppress
the pain. Reserve grounds, virtual or otherwise, for feeding
asymmetric antennas like longwires. *They* need that current
mirror to replace the other half of their symmetry. If you
try to compensate for a hot shield with a balance wire, you
are still screwing up the antenna's design radiation pattern

since the feedline is now part of the radiating structure.

Subject: Good customer service - ICOM

I can second Gary's comments about ICOM. Right after I purchased my 820H I was attempting the expanded receive mod and slipped with the soldering iron and damaged a diode. Not only did ICOM ship the part to me at no charge, they also shipped a wiring and componet location sheet to assist me.

Gary Fiber in tech support has also been top notch for questions. He even emailed me on a Saturday about a problem I was having with a ICOM amp!

Needless to say I have purchased several ICOM unit since! Customer service is key and ICOM understands it!

Herb, That's about as good as worrying about the color of paint. The
location of the supply and what it plugs into have no effect on the
parameters mentioned.
I can think of threads of logic that may be distorted into forming that
conclusion, but it is a giant leap.

You hear a lot of strange stuff if you listen long enough.

From: dsnowden@ccd.harris.com (Doug Snowden)
Subject: 572B tube in Collins 30L1 ???

Subject says it. Will the 572B tube fit in the 30L1? Physically? It
might be a bit bigger than the 811A tube, I don't know. If it will
fit, is it electrically near the 811A? What is the result, more power?
More reliablity? Or a waste of money?

Along the same line, what is the advantage of using a ceramic based
811A as opposed to the bakelite based ones? I see RF parts advertise
the ceramic based ones at quite a bit more money..

From: "Manuel A. Maseda WF1J" <mmaseda@packet.net>
Subject: 572B tube in Collins 30L1 ???

Doug,

572B will work just fine in a 30L-1. You won't get anymore
power out but they will last forever. Collins recommends that
you change out one of the one of the caps in the 30L-1 for
best operation with a 572B but I've tried them with a stock
unit and it seemed to work fine. If your really interested in
this mod I can dig through my stuff and tell you which cap to
change.

As far as the ceramic based 811A, I've used bakelite 811 and
811A tubes for years and have never found any problems. I
wouldn't spend any extra for a ceramic base but if its the same
price, why not!

From: nepaleduc@aol.com (Nepal educ)
Subject: 800 MHz mod - C508A

Hi,

I have noted that my C508A picks up cellular conversations on the image
frequency. The C508A first IF is 23.05 MHz, so my guess is that the
images will be 46.1 MHz higher than the 870-890 MHz cell site outputs, ie
916.1MHz to 936.1 MHz. Set the frequency offset to 30 KHz and snoop away!

The image sensitivity is of course not good - I live on a hill and the S
meter doesn't go to S9, but it seems better than having a mods butcher
pulling such an intricate package apart!

Subject: what's mods for Icom 260E ?
~~~~~~

If this radio is similiar to my old IC-255A one of the pins on the mike connector if grounded will start the VCO incrementing and a 1K ohm resistor across the pin to ground will start the VCO decrementing, or visa versa. Hope this helps.

: >swdecato@nps.navy.mil

: Steve, are you sure the battery power is dropping off or is it the
: radio that is reducing the transmit power output? I believe the user
: manual states that when you use a high power batter pack or DC
: adapter, the radio may overheat from the higher power output and when
: it overheats, it automatically reduces its output power level. I have
: never had mine get hot enough to completely quit transmitting, but it
: sounds like that might be your problem. I hope this helps...73's
: Floyd WD5ENJ

I'll add my two-cents worth here. You are both partially right.
I have had my FT51R heat up enough to shift to low power and then
to stop transmitting. You will notice that it is in low power
because the transmit scale will be half or a quarter of what it
would be in full power. When it finally overheats, it will actually
stop transmitting. That is your red transmit light will switch
to green even though you have the PTT pressed.

Unfortunately, except for the blisters on your palms, the transition
to low power and then no power associated with over heating is
indistinguishable from the same transitions you would see if you

were on low battery.

To answer the original question, my understanding is that the EDC-12
is a trickle charge, but that it does not bypass the battery, so you
can at high power draw more current from the battery than it is putting
in. I use the bulkier PA-10A, which does give you full power bypass
and trickle charge.

I hope that helps, and by the way, has anyone come up with a heat sync
for this radio? I have a couple of drawings, but I don't know what
material to use. Currently, I have had some sucess wrapping an ice
cube in a paper towel, and rubbing along the back of the radio. This
works best if you remove the belt clip and use a speaker mike. I know
that this is unworkable for most folks, but it does work in a pinch.
As long as you keep the radio dry, you can pull a lot of heat out
of the radio in a few seconds.

Overloads easily, and has a terrible noise figure. Mutek (England)
has a replacement front end board that will fix this radio. I've
used it in a IC211, and it does wonders for strong signal handling
and for reducing the system noise figure.

You did not say how large a battery you wanted, which would help.
Assuming you are in the market for something other than palm sized you
should try Sears. They have a range of gell cells at attractive prices
available on special order from their auto centers. At least that's
what the flyer they were handing out at the last Miami Boat Show
indicated. Failing Sears, try West Marine or Boat/US. The 800
information operator can give you their numbers.

Probably a FAQ, but I'm new to HAM....

I just passed my no-code yesterday and am looking to purchase an 2m/70cm handheld. 1-1/4 would be nice, but... What I would like is to hear from some experienced handheld users as to the types of features that are particularly handy (e.g. num. of memories, EEPROM, etc.) Also, if there are any particular units worth considering, I'd appreciate some input as to your experience with the units. I appreciate your input. Feel free to e-mail me, however, I would guess that there are plenty of new HAMs looking for the same, so a post is preferred.

Hi all,

Just wondering what experience folks have had with the "big three", or others, and their response to e-mail. You would think these technological giants would be "online", wouldn't you? The companies advertise their e-mail addresses, so you would think they read it !

My experiences vary-

Kenwood: I have written twice, asking about spare parts for some 10 year old HT's that I have. Absolutely no response, after about 2 1/2 weeks. I know, the radios are old, but the way I see it, if I can't get spares info for these,, why should I think it would be any different with new gear?

Icom: I wrote, asking for modification info, and clarification of the manual, for the IC-2340. I received a reply the next day, with a follow-up letter via US mail. I had already purchased the radio, so ICOM had nothing really to gain by being so fast.

Yaesu: I have not had experience with Yaesu.

Are these responses normal??

Subject: FT530 programming

I have what may be a very unusual but interesting question. A few months ago,
I encountered a lot of talk about whether memory settings could be cloned from
one FT530 to another. I believe that the answer was yes and that it could be
done through the 1/8" jack of the spkr/mic plug. Recently, Yaesu has come out with the
FT51R which is programmable (not just cloneable) through this plug.
An I correct in assuming that the 51 programming software would work on the
530? What do you think?

From: dave@diusys.cms.udel.edu (Dave Dabell)
Subject: K-com filters and Telephone RFI

Yes, I've used a K-com filter on an at&t trimline-like phone (keypad in
the handset). This was a newer electronic model that had a volume level
switch for rcvd audio. It picked up rf bad enough to hear it across the
room. After installing a K-com at the handset rf could still be heard,
but it was less than 1/2 as loud as the voice at the other end of the
line. Quite a reduction.
Inside the k-com is a torroid with maybe 30 turns of small gauge wire
for each side of the line. So it appears to be just a choke. I assume
it has quite a bit more inductance than you could get by wrapping the
cord around a snap on choke.
Good luck with the rfi. If all else fails, you could always go back to
an old ma bell model. They were pretty rf-proof.

Subject: KENWOOD RELIABILITY

Well Ed,
Out of 5 rigs (TS-440's) we bought, all five failed with the VCO
glue. I fixed my own, the rest sent them in for repair. One has been
repaired in other ways, but that's because N1JWR won't take the time to
get his 13 W/M!!! And so the rig languishes, waiting for a warm hand to
carress... but I digress...

My Kenwood 741 has stopped transmitting on the 6 meter module, and now
the 2 meter module...

My guess is... they just arn't all that well designed, just adequate for
the dainty ham operator. (I'm a HAM fisted 24 hour user...)

On the other hand, NOTHING I've ever owned didn't at one time or another
need fixin. Ask me about the ICOM W2A...

Tom

From: timsaw@ibm.net
Subject: Linkcomm uploads ACC voice

Linkcomm put up the ACC voice yesterday (8/25) for the RLC-3. I down loaded it
but it won't work for me. The 1.40 prom1.bin and prom2.bin seem ok but the
file length of the voice prom looks too short. Anyone else had this problem?

From: greg@core.rose.hp.com (Greg Dolkas)
Subject: Opinions - Alinco 610?

Has anybody had any experience with the new Alinco 610 dual band mobile?
I'm trying to decide between it and the Kenwood 733 (about which a lot has
been posted, not all of it good).

I'm most interested in its usability, followed by performance and features.

Thanks!

Greg KO6TH

Gary,

I bought a DSP-59+ a few weeks ago and have been very pleased with it.
It does a great job on both CW and SSB, and the noise reduction works
very well. You can hear your sidetone; just set the center frequency
to your sidetone frequency.

QST didn't actually pan it for its noise, IMHO. Their review mentioned
that you could hear some noise if you cranked the gain way up in the
absence of a signal. The unit's noise is not noticeable at all in
normal operation. I can hear a little bit of noise if I crank it all
the way up with no signal input, but its noise is inaudible if I
feed it audio from the receiver, even with the RF gain all the way down.

I'm not very impressed with most MFJ stuff, and from what I've heard,
their DSP probably leaves much to be desired in both performance and
workmanship. Just my $0.02 worth on Mighty Fine Junk.

Actually there are some advantages to the internal supply approach,
but you're right, Tom - it has nothing to do with the location of the
supply. Some of the internal supplies run significantly more than
12-15 volts, and this can be an advantage in some cases. Better IMD
and spectral purity from the PA are easier to achieve at the higher
voltages (28 to 30 volts) that these internal supplies offer. It's
also easier to make a 200 watt PA when it runs on 28v, which is why
the 200w output rigs generally have internal power supplies.

>standing waves on the feedline and that when you turn up the power
>some of that voltages gets back into the rig and confuses the display.

A resonant antenna can indeed need a transmatch. All resonance means
is that there's no net reactive component at the feedpoint. The

resistive component could be anything, depending on the particular
antenna geometry, and may need a transmatch to transform that impedance
to 50 ohms. In the case of a G5RV, it's longer than a halfwave
on 20 meters, 3/2-waves in fact. The feedpoint impedance should be
moderate, somewhere not too far from 50 ohms, but the G5RV is fed
with a 300 ohm balanced line section terminated into a coax. You're
not going to get 1:1 SWR on that balanced line (and probably not
on the coax either).

The fact that the line has SWR, however, has nothing to do with
RF in the shack. That's a balance problem, not a matching problem.
SWR on the line just means there are circulating differential
currents *inside* the line that form a standing wave pattern.
They can't get *out* of the line to cause a hot chassis unless
there is a system imbalance and parallel currents are flowing
on the *outside* of the coax. (From the point of view of currents
flowing inside coax, it is a balanced line. It's only for currents
flowing on the outside of the coax that imbalance is an issue.)

There are two kinds of balance involved here, physical and electrical.
Physical balance is important because the induction field can induce
a common mode current on the coax shield. Electrical balance is important
because it can upset the differential current balance of the feedline.

Physical balance is a matter of laying out the antenna and feedline
in a symmetrical manner, IE both legs of the antenna need to be mirror
images of each other with respect to themselves and to Earth, and the
feedline should be routed to bisect that symmetry.

Electrical symmetry is pretty much automatic if physical symmetry is
followed with regard to the antenna and the balanced line section.
The point where the coax attaches, however, can create an electrical
imbalance because shield currents can flow on both the inside and
outside of the shield at this connection point. This creates an
imbalance with respect to the currents flowing in the inner conductor.
A choke balun here (6 to 8 tight turns of the coax will do) will
restore the balance by stopping currents from flowing on the outside
of the shield.

>You might be able to make a virtual ground by attaching a 1/4
>wavelength (at operating frequency) piece of wire to the rig and just
>run it along the baseboard of the shack.

This may treat the *symptom*, but it doesn't address the cause.
A bilaterally symmetric antenna does not need a ground, virtual
or real, in order to perform properly. It's usually wise to
treat the brain tumor rather than just taking aspirn to suppress
the pain. Reserve grounds, virtual or otherwise, for feeding
asymmetric antennas like longwires. *They* need that current
mirror to replace the other half of their symmetry. If you
try to compensate for a hot shield with a balance wire, you
are still screwing up the antenna's design radiation pattern

since the feedline is now part of the radiating structure.

From: "Manuel A. Maseda WF1J" <mmaseda@packet.net>
Subject: 572B tube in Collins 30L1 ???

Doug,

572B will work just fine in a 30L-1. You won't get anymore
power out but they will last forever. Collins recommends that
you change out one of the one of the caps in the 30L-1 for
best operation with a 572B but I've tried them with a stock
unit and it seemed to work fine. If your really interested in
this mod I can dig through my stuff and tell you which cap to
change.

As far as the ceramic based 811A, I've used bakelite 811 and
811A tubes for years and have never found any problems. I
wouldn't spend any extra for a ceramic base but if its the same
price, why not!

From: nepaleduc@aol.com (Nepal educ)
Subject: 800 MHz mod - C508A

Hi,

I have noted that my C508A picks up cellular conversations on the image
frequency. The C508A first IF is 23.05 MHz, so my guess is that the
images will be 46.1 MHz higher than the 870-890 MHz cell site outputs, ie
916.1MHz to 936.1 MHz. Set the frequency offset to 30 KHz and snoop away!

The image sensitivity is of course not good - I live on a hill and the S
meter doesn't go to S9, but it seems better than having a mods butcher
pulling such an intricate package apart!

From: tcalof@minet.gov.mb.ca (Terry Calof)
Subject: Someone wanted IC-2GXAT mods

Somebody was looking for mods for the IC-2GXAT about 2 weeks ago. Here are
the ones I know about:

IC-2GXAT mods:
1) Extended rx (136-180 Mhz): Hold down F-Scan-Duplex keys at same time
and turn radio ON. Or, cut diode D13 on logic unit.
2) Extended tx. Cut diode D14 on logic unit.

I have done the keypad mod for extended rx and it works without any mishap
to the radio. 73/Terry VE4UC

: Steve, are you sure the battery power is dropping off or is it the
: radio that is reducing the transmit power output? I believe the user
: manual states that when you use a high power batter pack or DC
: adapter, the radio may overheat from the higher power output and when
: it overheats, it automatically reduces its output power level. I have
: never had mine get hot enough to completely quit transmitting, but it
: sounds like that might be your problem. I hope this helps...73's
: Floyd WD5ENJ

I'll add my two-cents worth here. You are both partially right.
I have had my FT51R heat up enough to shift to low power and then
to stop transmitting. You will notice that it is in low power
because the transmit scale will be half or a quarter of what it
would be in full power. When it finally overheats, it will actually
stop transmitting. That is your red transmit light will switch
to green even though you have the PTT pressed.

Unfortunately, except for the blisters on your palms, the transition
to low power and then no power associated with over heating is
indistinguishable from the same transitions you would see if you

were on low battery.

To answer the original question, my understanding is that the EDC-12
is a trickle charge, but that it does not bypass the battery, so you
can at high power draw more current from the battery than it is putting
in. I use the bulkier PA-10A, which does give you full power bypass
and trickle charge.

I hope that helps, and by the way, has anyone come up with a heat sync
for this radio? I have a couple of drawings, but I don't know what
material to use. Currently, I have had some sucess wrapping an ice
cube in a paper towel, and rubbing along the back of the radio. This
works best if you remove the belt clip and use a speaker mike. I know
that this is unworkable for most folks, but it does work in a pinch.
As long as you keep the radio dry, you can pull a lot of heat out
of the radio in a few seconds.

Overloads easily, and has a terrible noise figure. Mutek (England)
has a replacement front end board that will fix this radio. I've
used it in a IC211, and it does wonders for strong signal handling
and for reducing the system noise figure.

You did not say how large a battery you wanted, which would help.
Assuming you are in the market for something other than palm sized you
should try Sears. They have a range of gell cells at attractive prices
available on special order from their auto centers. At least that's
what the flyer they were handing out at the last Miami Boat Show
indicated. Failing Sears, try West Marine or Boat/US. The 800
information operator can give you their numbers.

I bought one a couple of weeks ago. I haven't talked much on it, but I have used it several times in a QSO with a friend on a repeater. On full 5 watts, it seems like it will be useable for at least twenty minutes of back and forth talking. On the next lower power (3.5 watts, I think) it seemed like we could just keep talking into the night. The back got a little warm, but evidently not warm enough to do anything during the 1.5 to 2 hours I was using it.

>Mike

Hello Mike,

The FT-51R is designed to reduce power output only when the internal temp sensor is very hot (this protects the finals). The FT-51R does produce 5 watts on both 2m & 440 w/ the E-DC-12 adapter or FNB-38 battery.

Hi Jay,

It is not possible to clone the FT-530 to another FT-530. That is why Yaesu never made a cloning cable for the FT-530. We have tried to make a PC program for the FT-530, but no luck. The FT-11/41/51 radios were designed to be PC programmed.

Good Luck and 73's

I agree with Joel. The guy who buys a radio with expectations of using for other than what intended should be able to read specifications sheets. The net result is that if he can't and bitches to everyone about it, he is either a gomer or a whiner. Many radios now on the market require modification to just get extended receive. Some involve the out of band transmit as well. Seek your own poison. At some point in time FCC will mandate type acceptance of transmitters requiring that they absolutely only work on frequencies specified.
The technical whizard who stated that dumping it back on the manufacturer never made mention that AM at best would require 10uv of signal to have a demodulation. Also, the technical wizard didn't mention that he was probably using a antenna cut for 144 and the wrong polorization as well.

>100T Is this a 100TH or 100TL? They are 5.0v 6.3a

DON'T put 6.3v on the 4-65's - the overvoltage is just enough to shorten
the life quite a bit. In fact, I'd put a series resistor in line such
that they got about 5.8 or 5.9 if you're going to use them for display
purposes.

A friend of mine ran into this problem on an old GE Progress line 440
transmitter that he had modified for 220mhz. Aparently some GE EP-4
power supplies got out the door with an extra turn on the filament
transformer - a 1/2 ohm 5 watt resistor in line with the winding brought
the voltage from 7.<something> to 6.3 and boosted the 6907 tube life
from 8 months to several years.

Source record: 213395

I purchased a FND-26 battery for my Yeasu ft-530 about one
year ago from Periphex. The price was right, about half what
Yeasu wanted for the same battery.

Recently, the battery quite taking a charge. I have not really
used it that many times (maybe 15-20 charges). I just wanted
to know, is this a case of you get what you pay for or was it
just a fluke that this particular battery went bad.

The battery that came with the radio is still working fine and it
has gone through several more charging cycles than the one
I purchased from Periphex.

Anyone else out there had a good or bad experience with Periphex
batteries.

1104. Kenwood repair?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-08-27 00:00:00 UTC
From: stever@raven.cybercomm.net
Message-ID: <41omua$2d3@crow.cybercomm.net>
Source record: 213397

I have a Kenwood 940a that needs some repair. Does anyone have any opinions as to which facility gives better/more successful service between California or Virginia. Problem tends to be intermittent PLL and display problems. I expect if I send it out, it will just come back with same unfixed problem.

Thanks, Steve WA2NHZ

ps not simple dirty or loose grounds or molex connectors...I think the VCO has to have wax removed and I don't want to get involved with that.

either post here to group or e-mail to: stever@raven.cybercom.com

HE-E-E-LP!
I'm trying to find software or any info on the manufacturer of a TV tuner card for IBM compatibles.

I've got a TV tuner card that supposedly will also do frame grabbing. I'd like to use this for slowscan TV if I can find the manufacturer or the software. I'd appreciate any suggestions or pointers toward a more appropriate group. HAS ANYONE SEEN THIS CARD?
Thanks in advance, Fred (KD4WOS)

Details:
* 16 bit ISA card
* No manufacturer name on the card, but it does have a logo silkscreened on the board: A desktop computer with monitor on top, and a set of TV antenna rabbit ears coming out of the monitor.
*FCC ID: F2PTV
*Has "RBG" etched and Patent Pending screened on lower left of board.
*Some of the chips include a Chips & Tech F28C9001, several Phillips chips (TDA4680 for one)...
*Probably mfg'd around 1992, based on chip date codes (9135)

I hope someone here knows the answer to this. I used to Telnet to....
callsign.cs.buffalo.edu 2000 and use their online callbook. I know there are a
lot of others, but this one would let you look up a persons NAME, etc. I used
it to find a friend, since he has long since changed his call.

I tried it yesterday and it did not respond with the callsign server. Anyone
know what happened, or of another one that lets you use NAME as an input?

1107. Computer Control of Icom IC-R7100

Newsgroup: rec.radio.amateur.equipment
Date: 1995-08-27 00:00:00 UTC
From: pbutlalj@ia.net
Message-ID: <41qoge$i0m@hera.ia.net>
Source record: 213400
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc

Hello,

I have a friend with one of these radios and he would like to
build the interface and program his own computer to control the radio.
The only problem that he has is that he cannot find the protocols that
the radio uses to be controlled. He would like to get the information
that is needed to make the radio listen to the computer commands. He is
most interested in the data bits and the baud rate and what the actual
commands are that need to be sent out the computer serial port.

Please respond via E-mail and here if you have an answer to this.
He realizes that he could do the solution by throwing money at the
problem but he wishes to do it the old fashioned way and do it himself.

Subject: FT530 programming

I have what may be a very unusual but interesting question. A few months ago,
I encountered a lot of talk about whether memory settings could be cloned from
one FT530 to another. I believe that the answer was yes and that it could be
done through the 1/8" jack of the spkr/mic plug. Recently, Yaesu has come out with the
FT51R which is programmable (not just cloneable) through this plug.
An I correct in assuming that the 51 programming software would work on the
530? What do you think?

From: dave@diusys.cms.udel.edu (Dave Dabell)
Subject: K-com filters and Telephone RFI

Yes, I've used a K-com filter on an at&t trimline-like phone (keypad in
the handset). This was a newer electronic model that had a volume level
switch for rcvd audio. It picked up rf bad enough to hear it across the
room. After installing a K-com at the handset rf could still be heard,
but it was less than 1/2 as loud as the voice at the other end of the
line. Quite a reduction.
Inside the k-com is a torroid with maybe 30 turns of small gauge wire
for each side of the line. So it appears to be just a choke. I assume

it has quite a bit more inductance than you could get by wrapping the
cord around a snap on choke.
Good luck with the rfi. If all else fails, you could always go back to
an old ma bell model. They were pretty rf-proof.

Subject: KENWOOD RELIABILITY

Well Ed,
Out of 5 rigs (TS-440's) we bought, all five failed with the VCO
glue. I fixed my own, the rest sent them in for repair. One has been
repaired in other ways, but that's because N1JWR won't take the time to
get his 13 W/M!!! And so the rig languishes, waiting for a warm hand to
carress... but I digress...

My Kenwood 741 has stopped transmitting on the 6 meter module, and now
the 2 meter module...

My guess is... they just arn't all that well designed, just adequate for
the dainty ham operator. (I'm a HAM fisted 24 hour user...)

On the other hand, NOTHING I've ever owned didn't at one time or another
need fixin. Ask me about the ICOM W2A...

Tom

Gary,

I bought a DSP-59+ a few weeks ago and have been very pleased with it.
It does a great job on both CW and SSB, and the noise reduction works
very well. You can hear your sidetone; just set the center frequency
to your sidetone frequency.

QST didn't actually pan it for its noise, IMHO. Their review mentioned
that you could hear some noise if you cranked the gain way up in the
absence of a signal. The unit's noise is not noticeable at all in
normal operation. I can hear a little bit of noise if I crank it all

the way up with no signal input, but its noise is inaudible if I
feed it audio from the receiver, even with the RF gain all the way down.

I'm not very impressed with most MFJ stuff, and from what I've heard,
their DSP probably leaves much to be desired in both performance and
workmanship. Just my $0.02 worth on Mighty Fine Junk.

>location of the supply and what it plugs into have no effect on the
>parameters mentioned.
>I can think of threads of logic that may be distorted into forming that
>conclusion, but it is a giant leap.

Actually there are some advantages to the internal supply approach,
but you're right, Tom - it has nothing to do with the location of the
supply. Some of the internal supplies run significantly more than
12-15 volts, and this can be an advantage in some cases. Better IMD
and spectral purity from the PA are easier to achieve at the higher
voltages (28 to 30 volts) that these internal supplies offer. It's
also easier to make a 200 watt PA when it runs on 28v, which is why
the 200w output rigs generally have internal power supplies.

>resonant antenna would not need a transmatch. I suspect you have
>standing waves on the feedline and that when you turn up the power
>some of that voltages gets back into the rig and confuses the display.

A resonant antenna can indeed need a transmatch. All resonance means
is that there's no net reactive component at the feedpoint. The
resistive component could be anything, depending on the particular
antenna geometry, and may need a transmatch to transform that impedance
to 50 ohms. In the case of a G5RV, it's longer than a halfwave
on 20 meters, 3/2-waves in fact. The feedpoint impedance should be
moderate, somewhere not too far from 50 ohms, but the G5RV is fed
with a 300 ohm balanced line section terminated into a coax. You're
not going to get 1:1 SWR on that balanced line (and probably not
on the coax either).

The fact that the line has SWR, however, has nothing to do with
RF in the shack. That's a balance problem, not a matching problem.
SWR on the line just means there are circulating differential
currents *inside* the line that form a standing wave pattern.
They can't get *out* of the line to cause a hot chassis unless
there is a system imbalance and parallel currents are flowing
on the *outside* of the coax. (From the point of view of currents
flowing inside coax, it is a balanced line. It's only for currents
flowing on the outside of the coax that imbalance is an issue.)

There are two kinds of balance involved here, physical and electrical.
Physical balance is important because the induction field can induce
a common mode current on the coax shield. Electrical balance is important
because it can upset the differential current balance of the feedline.

Physical balance is a matter of laying out the antenna and feedline
in a symmetrical manner, IE both legs of the antenna need to be mirror
images of each other with respect to themselves and to Earth, and the
feedline should be routed to bisect that symmetry.

Electrical symmetry is pretty much automatic if physical symmetry is
followed with regard to the antenna and the balanced line section.
The point where the coax attaches, however, can create an electrical
imbalance because shield currents can flow on both the inside and
outside of the shield at this connection point. This creates an
imbalance with respect to the currents flowing in the inner conductor.
A choke balun here (6 to 8 tight turns of the coax will do) will
restore the balance by stopping currents from flowing on the outside
of the shield.

>You might be able to make a virtual ground by attaching a 1/4
>wavelength (at operating frequency) piece of wire to the rig and just
>run it along the baseboard of the shack.

This may treat the *symptom*, but it doesn't address the cause.
A bilaterally symmetric antenna does not need a ground, virtual
or real, in order to perform properly. It's usually wise to
treat the brain tumor rather than just taking aspirn to suppress
the pain. Reserve grounds, virtual or otherwise, for feeding
asymmetric antennas like longwires. *They* need that current
mirror to replace the other half of their symmetry. If you
try to compensate for a hot shield with a balance wire, you
are still screwing up the antenna's design radiation pattern
since the feedline is now part of the radiating structure.

Subject: Good customer service - ICOM

I can second Gary's comments about ICOM. Right after I purchased my 820H I was attempting the expanded receive mod and slipped with the soldering iron and damaged a diode. Not only did ICOM ship the part to me at no charge, they also shipped a wiring and componet location sheet to assist me.

Gary Fiber in tech support has also been top notch for questions. He even emailed me on a Saturday about a problem I was having with a ICOM amp!

Needless to say I have purchased several ICOM unit since! Customer service is key and ICOM understands it!

Herb, That's about as good as worrying about the color of paint. The
location of the supply and what it plugs into have no effect on the
parameters mentioned.
I can think of threads of logic that may be distorted into forming that
conclusion, but it is a giant leap.

You hear a lot of strange stuff if you listen long enough.

From: dsnowden@ccd.harris.com (Doug Snowden)
Subject: 572B tube in Collins 30L1 ???

Subject says it. Will the 572B tube fit in the 30L1? Physically? It might be a bit bigger than the 811A tube, I don't know. If it will fit, is it electrically near the 811A? What is the result, more power? More reliablity? Or a waste of money?

Along the same line, what is the advantage of using a ceramic based 811A as opposed to the bakelite based ones? I see RF parts advertise the ceramic based ones at quite a bit more money..

Subject: 572B tube in Collins 30L1 ???

Doug,

572B will work just fine in a 30L-1. You won't get anymore power out but they will last forever. Collins recommends that you change out one of the one of the caps in the 30L-1 for best operation with a 572B but I've tried them with a stock unit and it seemed to work fine. If your really interested in this mod I can dig through my stuff and tell you which cap to change.

As far as the ceramic based 811A, I've used bakelite 811 and 811A tubes for years and have never found any problems. I wouldn't spend any extra for a ceramic base but if its the same price, why not!

From: nepaleduc@aol.com (Nepal educ)
Subject: 800 MHz mod - C508A

Hi,

I have noted that my C508A picks up cellular conversations on the image frequency. The C508A first IF is 23.05 MHz, so my guess is that the images will be 46.1 MHz higher than the 870-890 MHz cell site outputs, ie 916.1MHz to 936.1 MHz. Set the frequency offset to 30 KHz and snoop away!

The image sensitivity is of course not good - I live on a hill and the S meter doesn't go to S9, but it seems better than having a mods butcher pulling such an intricate package apart!

Cheers,

: >steve
: >KA5DLB
: >swdecato@nps.navy.mil

: Steve, are you sure the battery power is dropping off or is it the
: radio that is reducing the transmit power output? I believe the user
: manual states that when you use a high power batter pack or DC
: adapter, the radio may overheat from the higher power output and when
: it overheats, it automatically reduces its output power level. I have
: never had mine get hot enough to completely quit transmitting, but it
: sounds like that might be your problem. I hope this helps...73's
: Floyd WD5ENJ

I'll add my two-cents worth here. You are both partially right.
I have had my FT51R heat up enough to shift to low power and then

to stop transmitting. You will notice that it is in low power
because the transmit scale will be half or a quarter of what it
would be in full power. When it finally overheats, it will actually
stop transmitting. That is your red transmit light will switch
to green even though you have the PTT pressed.

Unfortunately, except for the blisters on your palms, the transition
to low power and then no power associated with over heating is
indistinguishable from the same transitions you would see if you
were on low battery.

To answer the original question, my understanding is that the EDC-12
is a trickle charge, but that it does not bypass the battery, so you
can at high power draw more current from the battery than it is putting
in. I use the bulkier PA-10A, which does give you full power bypass
and trickle charge.

I hope that helps, and by the way, has anyone come up with a heat sync
for this radio? I have a couple of drawings, but I don't know what
material to use. Currently, I have had some sucess wrapping an ice
cube in a paper towel, and rubbing along the back of the radio. This
works best if you remove the belt clip and use a speaker mike. I know
that this is unworkable for most folks, but it does work in a pinch.
As long as you keep the radio dry, you can pull a lot of heat out
of the radio in a few seconds.

Overloads easily, and has a terrible noise figure. Mutek (England)
has a replacement front end board that will fix this radio. I've
used it in a IC211, and it does wonders for strong signal handling
and for reducing the system noise figure.

You did not say how large a battery you wanted, which would help.
Assuming you are in the market for something other than palm sized you
should try Sears. They have a range of gell cells at attractive prices
available on special order from their auto centers. At least that's
what the flyer they were handing out at the last Miami Boat Show
indicated. Failing Sears, try West Marine or Boat/US. The 800
information operator can give you their numbers.

From: glidden@greene.pgh.net (Jack Glidden)
Subject: WTB: Tone pad TR-7600 (Kenwood)

I am looking for the tone pad for the Kenwood TR-7600. The unit plugs
in the back into a 3 or 4 pin socket. If you have one of these lying
around, or know how I might wire one up, please send me email.

PS I know that I can go to Radio Shack and pick up a audio tone pad
that I could use into the mic, but I would rather have a plug in unit
if possible.

Thanks .

My IC-28A and R2000(Kenwood SW) both had the same symptons as you
describe. The internal Lithuim back up 3v batery (Br2026???) went
south. You can likeky get these bateries at Radio Shack.
My R2000 wnet thru Litiums cells about every 6mths. I used one of
those large "C" backup cells(about 1F at 5v) in both the IC-28A and
the R2000. I forget what value of resitor I used to charge the "C".
My IC-28A will go at least 2Mths without lossing its mem.

Subject: 2 Meter + Business VHF

The question is: Are there any radios that can do 2m FM and High Band
commercial?

The Bendix/King and other were mentioned. Add to this the Motorola Saber
handheld.These can be found on the used market. It helps if you have a source
inside of Motorola. If you want a mobile try a Motorola Syntor, and if you
what complete frequency agility as opposed to a prom-bound radio you need to

get yourself an Anaconda control head for the Sytor, I don't have the address handy but I will post it later.

Subject: DSP Filter Advice??

>I operate CW most of the time and am interested in either the Timewave 59+
>or MFJ 784B. Any advice? The areas of most concern are:

I've had both here and the MFJ is much better for CW.

>Does the unit generate its own noise? This is really irritating when I
>use an AF to filter out faults in the receiver (hiss, AGC pop) as well as
>for selectivity. I listen with headphones. QST panned the 59+ in this
>area.

I've heard the early 784 sucked in this area, but the 784B I use is very very quiet.

>How does the unit handle CW spotting?

You push a button and hear a tone that matches the filter center frequency. Like zero beating.

> Can you hear your own sidetone if it's the same frequency as the received >signal?

You can either program the sidetone internally or use a T/R line that bypasses the filter on TX. I bypass mine and run QSK with no problems.

>How well does the noise reducton feature work?

OK, but better with wide selectivity. I think any audio noise limiter is asking for a lot though!

[snip]

Yep, my ICOM 24-ATs had the same problem. The way I fixed 'em was
to slightly mash the threads on the BNC where the spanner nut holds
the BNC to the case, then torque the nut down as tightly as possible.
Then re-solder the wire inside the case. I had intended to locktite
the BNC but haven't needed to. They are staying in place despite
repeated duckie removal and car antenna hooking. Even the briefcase
bend hasn't bothered them. It's been well over a year since I fixed
them and so far no trouble.
The biggest trouble I have now is the ^%$#@* power jack keeps failing.

Subject: 2m/70cm Handheld Reccomendations ?

Probably a FAQ, but I'm new to HAM....

I just passed my no-code yesterday and am looking to purchase an 2m/70cm handheld. 1-1/4 would be nice, but... What I would like is to hear from some experienced handheld users as to the types of features that are particularly handy (e.g. num. of memories, EEPROM, etc.) Also, if there are any particular units worth considering, I'd appreciate some input as to your experience with the units. I appreciate your input. Feel free to e-mail me, however, I would guess that there are plenty of new HAMs looking for the same, so a post is preferred.

>this is my experience with them.
>73 gud luck
>kd4gan

Something was wrong with that Isopole, or its feedline. The 440 Isopole is a very well made antenna, and normally works quite well. (Of course it doesn't have the gain of a big colinear, but what did you expect? It should easily outperform a Ringo or a rubber duck.)

The 2m Isopole is a bit cheesier, you have to supply the mast part yourself. If you put it together right, and get good electrical connections to the mast you supply, it'll still beat a 2m Ringo (of course nearly anything will).

Hmmm, it seems I'm damning the Isopoles with faint praise. Well, they aren't the best antennas out there, and they aren't the cheapest antennas for what they do, but still they aren't as bad as your experience would indicate.

From: rfs@usa.net (Rich Scheuerer)
Subject: Equipment donations appreciated

I have recently introduced a number of students, by way of a short class, to amateur radio. The response by them was very positive and I have made one of my goals for this next semester to get a station going for them at the school. Equipment donation of any sort would be very helpful.

The school is called the Challenge School and is a charter school for the Cherry Creek School district located in southeast Aurora, Colorado. It emphasizes education in the sciences and a station would fit right in with not
only their curriculum but the interest expressed by many students I have spoken with. The grades of focus are 3rd to 8th, with middle school grades (6,7,8) being where the most interest has been.

For myself, this is a first experience, and am very much looking forward to following thru on this if I can get the needed gear. Unfortunately, there is not any current funding for it so donations is the way to go.

If you have any donations, I will provide you with a receipt clearly indicating the schools appreciation and the approximate value if you would like for tax deductibility. Please enclose the estimated value of the equipment if you have any idea. This station is starting from zero, so anything would be great and we are very much hoping someone has a tranceiver which they would like to pass along to a very curious bunch of kids!

Thanx much,

Rich Scheuerer, K0ZX aka rfs@usa.net

>design from scratch is needed)

Commercial flash converters that can handle HF are rarely over 8 bit
resolution, and that's not nearly enough. A bit of clever scaling
should let you parallel two of these to get 16 bits. But these converters
are still in the $100 range, I think that may be the wrong approach.

A 1 bit flash converter working at HF is rather trivial, even in discretes.
It seems to me that using a heavily oversampled 1 bit converter and
decimation of the resulting bit stream should give us what we want without
needing to wait for the chip makers to give us an integrated solution.
Remember, we only have to sample at a multiple of the receiving *bandwidth*,
and not at a mulitiple of the actual IF frequency because such sampling
aliases down to baseband. Opinions?

From: jeff.sumberg@sailboard.com (JEFF SUMBERG)
Subject: Heathkit HO-10 Monitor Scope question.

I recently bought a Heathkit HO-10 monitor scope at a hamfest. I'd like to locate somebody else with one of these. I have two questions to ask you:

1 - Do you have the manual? I am missing page 41 of my manual. The manual say "Condensed Manual" on the front, and carries the number 595-578-1. I'd like to get the missing page. (scanned->UUencode->Email, or FAX, or mail a copy).

2 - When the scope is in operation, the trace appears as a broken line rather than a solid line from edge to edge. As you turn up the sweep rate, the segments get smaller and more of them appear across the face of the tube (about 2 segments when slow, about 6-10 when at fast sweep). Is this normal operation? The unit works fine, and the displayed patterns look good, except for this "broken up" appearance.

This isn't the way they are shown in the manual which leads me to believe there is some signal, like a square wave, riding on the vertical deflection section (just a guess). I figured before I looked into the unit I'd ask.

Thanks in advance.

You're learning. :-)

However, don't be so dogmatic, Kenwood may (insert miraculous intervention
of the Virgin here) get their act together with VHF/UHF rigs one day.
Remember, it wasn't that long ago when Yaesu couldn't build a HF rig,
now they're the top dog in that department. Changes can happen, so
keep your options open.

Gary

From: billv@olympus.net (Bill Vaughn)
Subject: mfj-8621 packet radio probs

I just received an mfj-8621 packet data radio (after waiting 8 months) I put new factory xtals in it and retuned the unit. After checking it with my service monitor I discovered that upon tx key the freq drifted from about 2k away to an onfrequency condition but it took aprx a second for it to do so.

I am delaying the tx key for that amount of time but it seems to negate the fast diode switching. It has no heater for the xtal but I have worked on many
radios with no oven that did not do this. Any suggestions for a fix.

>power? More reliablity? Or a waste of money?

The 572B is virtually identical to the 811A but with a much greater
plate dissipation (160W VS 65W). Unfortunately, in order to make use
of that additional dissipation, you need to raise the plate
supply to about 2500V. Personally, I wouldn't spend the extra money
as replacements for the Collins.

>Along the same line, what is the advantage of using a ceramic based
>811A as opposed to the bakelite based ones? I see RF parts advertise
>the ceramic based ones at quite a bit more money..

I'm not aware of any advantages offered by the ceramis base, but maybe
there's another reason for the price difference. Wonder if the
ceramics are U.S. made?

Yes Gary, but the original question was would an internal power supply
improve the RECEIVERS dynamic range, noise floor, etc.

I sure think the correct answer to that question was NO.

>73 Tom

One reason I can think of for that being true, is that most internal
power supplies are better built by the manufacturers than a cheap
external power supply a user may use in some cases. If you use a good

quality external power supply, then the should be no difference in
reception.

Subject: FT530 programming

I have what may be a very unusual but interesting question. A few months
ago,
I encountered a lot of talk about whether memory settings could be cloned
from
one FT530 to another. I believe that the answer was yes and that it could
be
done through the 1/8" jack of the spkr/mic plug. Recently, Yaesu has come
out with the FT51R which is programmable (not just cloneable) through this
plug.
An I correct in assuming that the 51 programming software would work on the
530? What do you think?

From: dave@diusys.cms.udel.edu (Dave Dabell)
Subject: K-com filters and Telephone RFI

Yes, I've used a K-com filter on an at&t trimline-like phone (keypad in
the handset). This was a newer electronic model that had a volume level

switch for rcvd audio. It picked up rf bad enough to hear it across the room. After installing a K-com at the handset rf could still be heard, but it was less than 1/2 as loud as the voice at the other end of the line. Quite a reduction.
Inside the k-com is a torroid with maybe 30 turns of small gauge wire for each side of the line. So it appears to be just a choke. I assume it has quite a bit more inductance than you could get by wrapping the cord around a snap on choke.
Good luck with the rfi. If all else fails, you could always go back to an old ma bell model. They were pretty rf-proof.

Subject: KENWOOD RELIABILITY

Well Ed,
Out of 5 rigs (TS-440's) we bought, all five failed with the VCO glue. I fixed my own, the rest sent them in for repair. One has been repaired in other ways, but that's because N1JWR won't take the time to get his 13 W/M!!! And so the rig languishes, waiting for a warm hand to carress... but I digress...

My Kenwood 741 has stopped transmitting on the 6 meter module, and now the 2 meter module...

My guess is... they just arn't all that well designed, just adequate for the dainty ham operator. (I'm a HAM fisted 24 hour user...)

On the other hand, NOTHING I've ever owned didn't at one time or another need fixin. Ask me about the ICOM W2A...

Tom

Gary,

I bought a DSP-59+ a few weeks ago and have been very pleased with it.
It does a great job on both CW and SSB, and the noise reduction works
very well. You can hear your sidetone; just set the center frequency
to your sidetone frequency.

QST didn't actually pan it for its noise, IMHO. Their review mentioned
that you could hear some noise if you cranked the gain way up in the
absence of a signal. The unit's noise is not noticeable at all in
normal operation. I can hear a little bit of noise if I crank it all
the way up with no signal input, but its noise is inaudible if I
feed it audio from the receiver, even with the RF gain all the way down.

I'm not very impressed with most MFJ stuff, and from what I've heard,
their DSP probably leaves much to be desired in both performance and
workmanship. Just my $0.02 worth on Mighty Fine Junk.

Actually there are some advantages to the internal supply approach,
but you're right, Tom - it has nothing to do with the location of the
supply. Some of the internal supplies run significantly more than
12-15 volts, and this can be an advantage in some cases. Better IMD
and spectral purity from the PA are easier to achieve at the higher
voltages (28 to 30 volts) that these internal supplies offer. It's

also easier to make a 200 watt PA when it runs on 28v, which is why
the 200w output rigs generally have internal power supplies.

>resonant antenna would not need a transmatch. I suspect you have
>standing waves on the feedline and that when you turn up the power
>some of that voltages gets back into the rig and confuses the display.

A resonant antenna can indeed need a transmatch. All resonance means
is that there's no net reactive component at the feedpoint. The
resistive component could be anything, depending on the particular
antenna geometry, and may need a transmatch to transform that impedance
to 50 ohms. In the case of a G5RV, it's longer than a halfwave
on 20 meters, 3/2-waves in fact. The feedpoint impedance should be
moderate, somewhere not too far from 50 ohms, but the G5RV is fed
with a 300 ohm balanced line section terminated into a coax. You're
not going to get 1:1 SWR on that balanced line (and probably not
on the coax either).

The fact that the line has SWR, however, has nothing to do with
RF in the shack. That's a balance problem, not a matching problem.
SWR on the line just means there are circulating differential
currents *inside* the line that form a standing wave pattern.
They can't get *out* of the line to cause a hot chassis unless
there is a system imbalance and parallel currents are flowing
on the *outside* of the coax. (From the point of view of currents
flowing inside coax, it is a balanced line. It's only for currents
flowing on the outside of the coax that imbalance is an issue.)

There are two kinds of balance involved here, physical and electrical.
Physical balance is important because the induction field can induce
a common mode current on the coax shield. Electrical balance is important
because it can upset the differential current balance of the feedline.

Physical balance is a matter of laying out the antenna and feedline
in a symmetrical manner, IE both legs of the antenna need to be mirror
images of each other with respect to themselves and to Earth, and the
feedline should be routed to bisect that symmetry.

Electrical symmetry is pretty much automatic if physical symmetry is
followed with regard to the antenna and the balanced line section.
The point where the coax attaches, however, can create an electrical
imbalance because shield currents can flow on both the inside and
outside of the shield at this connection point. This creates an
imbalance with respect to the currents flowing in the inner conductor.
A choke balun here (6 to 8 tight turns of the coax will do) will
restore the balance by stopping currents from flowing on the outside
of the shield.

>You might be able to make a virtual ground by attaching a 1/4
>wavelength (at operating frequency) piece of wire to the rig and just
>run it along the baseboard of the shack.

This may treat the *symptom*, but it doesn't address the cause.
A bilaterally symmetric antenna does not need a ground, virtual
or real, in order to perform properly. It's usually wise to
treat the brain tumor rather than just taking aspirn to suppress
the pain. Reserve grounds, virtual or otherwise, for feeding
asymmetric antennas like longwires. *They* need that current
mirror to replace the other half of their symmetry. If you
try to compensate for a hot shield with a balance wire, you
are still screwing up the antenna's design radiation pattern
since the feedline is now part of the radiating structure.

Subject: Good customer service - ICOM

I can second Gary's comments about ICOM. Right after I purchased my 820H I was attempting the expanded receive mod and slipped with the soldering iron and damaged a diode. Not only did ICOM ship the part to me at no charge, they also shipped a wiring and componet location sheet to assist me.

Gary Fiber in tech support has also been top notch for questions. He even emailed me on a Saturday about a problem I was having with a ICOM amp!

Needless to say I have purchased several ICOM unit since! Customer service is key and ICOM understands it!

Herb, That's about as good as worrying about the color of paint. The location of the supply and what it plugs into have no effect on the parameters mentioned.
I can think of threads of logic that may be distorted into forming that conclusion, but it is a giant leap.

You hear a lot of strange stuff if you listen long enough.

From: dsnowden@ccd.harris.com (Doug Snowden)
Subject: 572B tube in Collins 30L1 ???

Subject says it. Will the 572B tube fit in the 30L1? Physically? It
might be a bit bigger than the 811A tube, I don't know. If it will
fit, is it electrically near the 811A? What is the result, more power?
More reliablity? Or a waste of money?

Along the same line, what is the advantage of using a ceramic based
811A as opposed to the bakelite based ones? I see RF parts advertise
the ceramic based ones at quite a bit more money..

From: "Manuel A. Maseda WF1J" <mmaseda@packet.net>
Subject: 572B tube in Collins 30L1 ???

Doug,

572B will work just fine in a 30L-1. You won't get anymore
power out but they will last forever. Collins recommends that
you change out one of the one of the caps in the 30L-1 for
best operation with a 572B but I've tried them with a stock
unit and it seemed to work fine. If your really interested in
this mod I can dig through my stuff and tell you which cap to
change.

As far as the ceramic based 811A, I've used bakelite 811 and
811A tubes for years and have never found any problems. I
wouldn't spend any extra for a ceramic base but if its the same
price, why not!

From: nepaleduc@aol.com (Nepal educ)
Subject: 800 MHz mod - C508A

Hi,

I have noted that my C508A picks up cellular conversations on the image frequency. The C508A first IF is 23.05 MHz, so my guess is that the images will be 46.1 MHz higher than the 870-890 MHz cell site outputs, ie 916.1MHz to 936.1 MHz. Set the frequency offset to 30 KHz and snoop away!

The image sensitivity is of course not good - I live on a hill and the S meter doesn't go to S9, but it seems better than having a mods butcher pulling such an intricate package apart!

Cheers,

: Steve, are you sure the battery power is dropping off or is it the
: radio that is reducing the transmit power output? I believe the user
: manual states that when you use a high power batter pack or DC
: adapter, the radio may overheat from the higher power output and when
: it overheats, it automatically reduces its output power level. I have
: never had mine get hot enough to completely quit transmitting, but it
: sounds like that might be your problem. I hope this helps...73's
: Floyd WD5ENJ

I'll add my two-cents worth here. You are both partially right.
I have had my FT51R heat up enough to shift to low power and then
to stop transmitting. You will notice that it is in low power
because the transmit scale will be half or a quarter of what it
would be in full power. When it finally overheats, it will actually
stop transmitting. That is your red transmit light will switch
to green even though you have the PTT pressed.

Unfortunately, except for the blisters on your palms, the transition
to low power and then no power associated with over heating is
indistinguishable from the same transitions you would see if you
were on low battery.

To answer the original question, my understanding is that the EDC-12
is a trickle charge, but that it does not bypass the battery, so you
can at high power draw more current from the battery than it is putting
in. I use the bulkier PA-10A, which does give you full power bypass
and trickle charge.

I hope that helps, and by the way, has anyone come up with a heat sync
for this radio? I have a couple of drawings, but I don't know what
material to use. Currently, I have had some sucess wrapping an ice
cube in a paper towel, and rubbing along the back of the radio. This
works best if you remove the belt clip and use a speaker mike. I know
that this is unworkable for most folks, but it does work in a pinch.
As long as you keep the radio dry, you can pull a lot of heat out
of the radio in a few seconds.

Overloads easily, and has a terrible noise figure. Mutek (England)
has a replacement front end board that will fix this radio. I've
used it in a IC211, and it does wonders for strong signal handling
and for reducing the system noise figure.

You did not say how large a battery you wanted, which would help.
Assuming you are in the market for something other than palm sized you
should try Sears. They have a range of gell cells at attractive prices
available on special order from their auto centers. At least that's
what the flyer they were handing out at the last Miami Boat Show
indicated. Failing Sears, try West Marine or Boat/US. The 800
information operator can give you their numbers.

From: glidden@greene.pgh.net (Jack Glidden)
Subject: WTB: Tone pad TR-7600 (Kenwood)

I am looking for the tone pad for the Kenwood TR-7600. The unit plugs
in the back into a 3 or 4 pin socket. If you have one of these lying
around, or know how I might wire one up, please send me email.

PS I know that I can go to Radio Shack and pick up a audio tone pad
that I could use into the mic, but I would rather have a plug in unit
if possible.

Thanks .

Subject: Yaesu FT51R

I bought one a couple of weeks ago. I haven't talked much on it, but I
have used it several times in a QSO with a friend on a repeater. On full
5 watts, it seems like it will be useable for at least twenty minutes of
back and forth talking. On the next lower power (3.5 watts, I think) it
seemed like we could just keep talking into the night. The back got a
little warm, but evidently not warm enough to do anything during the 1.5
to 2 hours I was using it.

Charlie, I have bought crystals from a company called "MARDEN

Electronics" 1-800-222-6093. I have been happy with them. They were for a Mocom 70 and its working fine. The cost was 10.00 but that price (4/94) was for a 4 week wait. The faster you want them, the more they cost. also International Crystal is a good company. (I don't have their Phone # handy, Sorry. Our A repeater group back in Nashville used International with good luck. 73's Dale (KD4CVR)

>THX and 73s de KF4BUX Victor

Hi Victor,

My first thoughts are: Check to output and make sure your friends radio is not putting out more than 5 watts..... Also if the temp in the Car is really hot, the radio will reduce power earlier.

FYI and 73's

>steve
>KA5DLB
>swdecato@nps.navy.mil

Steve, are you sure the battery power is dropping off or is it the
radio that is reducing the transmit power output? I believe the user
manual states that when you use a high power batter pack or DC
adapter, the radio may overheat from the higher power output and when
it overheats, it automatically reduces its output power level. I have
never had mine get hot enough to completely quit transmitting, but it
sounds like that might be your problem. I hope this helps...73's

Hi John,

The PA-10 with a built-in fan was discontinued due to slow sales and
high price. The PA-10A (without a fan) replaces the PA-10 with a lower
price. Also the new E-DC-12 works great for it's low low price.

Hi Ed,

I can speak for Yaesu USA. I have to admit that we are slow to get on line. But, by year's end we will have a www page for Sales and hopefully service. So please hang in there. You can also reach us at yaesuusa@ix.netcom.com. We try to check email every day but, we travel around the country doing 3-4 shows a month so sometimes it takes 2-4 days for a response. Someday in the future we will have people full time taking service questions via email.

I picked up the ADMS-2 programming softwear/cable kit for the
FT-8500 Dual Band Mobil by Yaesu. Besides being able to program
up your radio w/ 1-100 freqs very quickly, I discovered under the
"Other" file menu a choice to change the extended receive to 300-530 Mhz
on UHF. I tried it out and receives just fine up there. The cost for the
kit is around $40-60.

Doug Hall (doughall@nando.net) wrote:

: Actually there are some advantages to the internal supply approach,
: but you're right, Tom - it has nothing to do with the location of the
: supply.

Several things can be made to run better if more than 13.8v is
available, obviously PA stages, less obviously RX front ends, but the
thing that makes the biggest improvement is having a higher voltage
supply available to drive the varactor diodes in the synthesiser VCO.
This reduces synthesiser phase noise quite significantly. Only a tiny
current is needed, so it would be possible to have a small inverter in a
13.8v radio, with incredible screening and filtering, of course.
Unfortunately this is almost unknown.

: 12-15 volts, and this can be an advantage in some cases. Better IMD
: and spectral purity from the PA are easier to achieve at the higher
: voltages (28 to 30 volts) that these internal supplies offer.

True, but some manufacturers noted that stage gain and linearity
were improved, so they reduced the amount of feedback around a stage to
trade off the improved linearity into more stage gain still at the old
level of linearity, then used the increased gain to economise by
reducing the number of stages. The result, more profit, same PA IMD.

It's
: also easier to make a 200 watt PA when it runs on 28v, which is why
: the 200w output rigs generally have internal power supplies.

Yes, true. Considering the cost of RF versus power supply devivces,
I'd design a 13.8v mobile radio using a power inverter and a 28/48v PA,
getting some benefits from regulation removing the usual sensitivity to
slight supply variations of the output power.

Higher supply voltges are most attractive for PAs, devices are
cheaper, and sometimes available surplus. The circulating currents are
less, copper, track, winding losses are reduced. Output transformer
ratios are less extreme

I'm unsure of the benefit of 200W output radios. If you want more
than 100W, 200W doesn't make much of an improvement, you might just as
well go the whole hog, and linear amplifiers are all designed to be
driven by 100w radios, anyway. 100 CLEAN Watts seems ideal to me.

Cheers

From: swdecato@nps.navy.mil
Message-ID: <41sgsq$sok@nps.navy.mil>
Source record: 213266

Minor annoyance with my FT-51R. I am using the large battery which gives the full 5w output. Fully charged the voltage indicates 11.4 volts. Without transmitting I get about 2 full days of usage (monitoring) before I have to recharge. The low battery indicator blinks just about 3 seconds before the display blinks and dies. That's not enough warning (and that assumes you had your eyes on the display when it happens). Mine quits when the voltage drops to 7 volts.

I too have the heat problem when running the radio using the EDC-12 in my car at high power. I try not to use high power because it sucks the battery dry so fast, its not worth it. I've tried all the battery saver options and still have the same problem.

On the lower power settings the radio is much more reliable. It is extremely easy to operate. The manual is not needed for most features.

I have rigged up an external 12v nicad power pack to use with the EDC-12 to see if I can get around my battery problems.

A suggestion for the fellow who complains of burning his hands when in the car... I use a speaker/mike (and leave it on a lower power setting). Also try to position the radio near your air conditioning duct.

deal?
>Any recommendations?
>-Paul
>KB2TCG
>
I bought and owned a 730 for several years when they first came out in
about 1982. I ran it almost exclusively mobile (in an 18 wheeler, at
that) and got very good service from it.

The price was not a heck of a lot more than that new. I suggest that you
read a few of the ham rags and maybe call a dealer or two and see if that
is a reasonable price. I think it may be a bit high.

Second, what kind of shape is it in? Has it been maintained well or has
it been knocking around in a car for 10 years? YOu amy want to put it on
a big antenna and listen around. As I recall, it does not have very good
rejection in heavy going...but the bands are so bad now, who cares...

I got good service from the rig. It seemed to work well on both cw and
ssb and I worked a ton of dx with it when the bands were good back in the
early 80s.

The rig doesn't have a lot of the features of the rigs today, but would
be an excellen low cost back up or mobile rig.

Good luck and 73

Gary Coffman (gary@ke4zv.atl.ga.us) wrote:

: Commercial flash converters that can handle HF are rarely over 8 bit
: resolution, and that's not nearly enough. A bit of clever scaling
: should let you parallel two of these to get 16 bits. But these converters
: are still in the $100 range, I think that may be the wrong approach.

Well, the only practical way of using a pair together gives you 9
bits not 16, I'm afraid, unless you go for something pretty involved

A pair could be used in a "Residue converter" scheme where a first
pass converter gets the top bits, feeds them to a >16 bit accurate fast
DAC, an analogue subtraction removes the DAC output from thesignal which
is then amplified and converted in the second stage to get the lower
bits...

I'm currently involved with digitising video signals (a much easier
task than amateur HF!) and I've got plenty of 10 bit 20 Megasample/sec
Analog Devices converters kicking around, and plelty of olf pensioned
off 8 bit 20 Megasample/sec flash converters too.

Some of the professional audio 1-bit oversampling devices are
beginning to get interesting. AD1879 44.1 kilosample 18 bit jobs could
just handle enough bandwidth for a very low IF, but 18 bits is their
structural width, and their actual resolution close to the top end of
their nyquist bandwidth is getting a bit degraded. I have a few samples
left over from an earlier project, so I might have a go with them
sometime.

Converter developers have made a push for more bits in the low speed
devices, and have been pushing the speed of 8 and 10 bit devices, but
they've not been so active in the speed/resolution area I'm looking for
because their activities relate to proven market demand. I'm not sure
there's much demand for much greater resolution in audio converters
considering the 16 bit design of the CD.. it's nice to have some extra
margin for overload etc and to allow digital gain control and mixing,
but, I think, they've got enough to satisfy the majority.

: A 1 bit flash converter working at HF is rather trivial, even in discretes.
: It seems to me that using a heavily oversampled 1 bit converter and
: decimation of the resulting bit stream should give us what we want without
: needing to wait for the chip makers to give us an integrated solution.

True, though I wouldn't do he decimation with discretes, although some
audiophile must be beavering away on a thermionic decimator, somewhere..
Using good quality integrators rather than IC process optimised
switched capacitor jobs might be good for the noise floot, too.

: Remember, we only have to sample at a multiple of the receiving *bandwidth*,
: and not at a mulitiple of the actual IF frequency because such sampling
: aliases down to baseband. Opinions?

There are a few snags to using ADC aliases directly, still you can
always come down to a nice low IF...

Cheers
David

From: dcomer@mack.rt66.com (David M. Comer)
Subject: 2m/70cm Handheld Reccomendations ?

Probably a FAQ, but I'm new to HAM....
```

I just passed my no-code yesterday and am looking to purchase an 2m/70cm handheld. 1-1/4 would be nice, but... What I would like is to hear from some experienced handheld users as to the types of features that are particularly handy (e.g. num. of memories, EEPROM, etc.) Also, if there are any particular units worth considering, I'd appreciate some input as to your experience with the units. I appreciate your input. Feel free to e-mail me, however, I would guess that there are plenty of new HAMs looking for the same, so a post is preferred.

>this is my experience with them.
>73 gud luck
>kd4gan

Something was wrong with that Isopole, or its feedline. The 440 Isopole is a very well made antenna, and normally works quite well. (Of course it doesn't have the gain of a big colinear, but what did you expect? It should easily outperform a Ringo or a rubber duck.)

The 2m Isopole is a bit cheesier, you have to supply the mast part yourself. If you put it together right, and get good electrical connections to the mast you supply, it'll still beat a 2m Ringo (of course nearly anything will).

Hmmm, it seems I'm damning the Isopoles with faint praise. Well, they aren't the best antennas out there, and they aren't the cheapest antennas for what they do, but still they aren't as bad as your experience would indicate.

From: rfs@usa.net (Rich Scheuerer)

Subject: Equipment donations appreciated

I have recently introduced a number of students, by way of a short class,
to amateur radio. The response by them was very positive and I have made one
of my goals for this next semester to get a station going for them at the
school. Equipment donation of any sort would be very helpful.

The school is called the Challenge School and is a charter school for the
Cherry Creek School district located in southeast Aurora, Colorado. It
emphasizes education in the sciences and a station would fit right in with not
only their curriculum but the interest expressed by many students I have
spoken with. The grades of focus are 3rd to 8th, with middle school grades
(6,7,8) being where the most interest has been.

For myself, this is a first experience, and am very much looking forward to
following thru on this if I can get the needed gear. Unfortunately, there is
not any current funding for it so donations is the way to go.

If you have any donations, I will provide you with a receipt clearly
indicating the schools appreciation and the approximate value if you would
like for tax deductibility. Please enclose the estimated value of the
equipment if you have any idea. This station is starting from zero, so
anything would be great and we are very much hoping someone has a tranceiver
which they would like to pass along to a very curious bunch of kids!

Thanx much,

Rich Scheuerer, K0ZX aka rfs@usa.net

>design from scratch is needed)

Commercial flash converters that can handle HF are rarely over 8 bit
resolution, and that's not nearly enough. A bit of clever scaling
should let you parallel two of these to get 16 bits. But these converters
are still in the $100 range, I think that may be the wrong approach.

A 1 bit flash converter working at HF is rather trivial, even in discretes.
It seems to me that using a heavily oversampled 1 bit converter and
decimation of the resulting bit stream should give us what we want without
needing to wait for the chip makers to give us an integrated solution.
Remember, we only have to sample at a multiple of the receiving *bandwidth*,
and not at a mulitiple of the actual IF frequency because such sampling
aliases down to baseband. Opinions?

From: jeff.sumberg@sailboard.com (JEFF SUMBERG)
Subject: Heathkit HO-10 Monitor Scope question.

I recently bought a Heathkit HO-10 monitor scope at a hamfest. I'd like to locate somebody else with one of these. I have two questions to ask you:

1 - Do you have the manual? I am missing page 41 of my manual. The manual say "Condensed Manual" on the front, and carries the number 595-578-1. I'd like to get the missing page. (scanned->UUencode->Email, or FAX, or mail a copy).

2 - When the scope is in operation, the trace appears as a broken line rather than a solid line from edge to edge. As you turn up the sweep rate, the segments get smaller and more of them appear across the face of the tube (about 2 segments when slow, about 6-10 when at fast sweep). Is this normal operation? The unit works fine, and the displayed patterns look good, except for this "broken up" appearance.

This isn't the way they are shown in the manual which leads me to believe there is some signal, like a square wave, riding on the vertical deflection section (just a guess). I figured before I looked into the unit I'd ask.

Thanks in advance.

You're learning. :-)

However, don't be so dogmatic, Kenwood may (insert miraculous intervention
of the Virgin here) get their act together with VHF/UHF rigs one day.
Remember, it wasn't that long ago when Yaesu couldn't build a HF rig,
now they're the top dog in that department. Changes can happen, so
keep your options open.

From: billv@olympus.net (Bill Vaughn)
Subject: mfj-8621 packet radio probs

I just received an mfj-8621 packet data radio (after waiting 8 months) I put new factory xtals in it and retuned the unit. After checking it with my service monitor I discovered that upon tx key the freq drifted from about 2k away to an onfrequency condition but it took aprx a second for it to do so.

I am delaying the tx key for that amount of time but it seems to negate the fast diode switching. It has no heater for the xtal but I have worked on many
radios with no oven that did not do this. Any suggestions for a fix.

>power? More reliablity? Or a waste of money?

The 572B is virtually identical to the 811A but with a much greater
plate dissipation (160W VS 65W). Unfortunately, in order to make use
of that additional dissipation, you need to raise the plate
supply to about 2500V. Personally, I wouldn't spend the extra money
as replacements for the Collins.

>Along the same line, what is the advantage of using a ceramic based
>811A as opposed to the bakelite based ones? I see RF parts advertise
>the ceramic based ones at quite a bit more money..

I'm not aware of any advantages offered by the ceramis base, but maybe
there's another reason for the price difference. Wonder if the
ceramics are U.S. made?

Yes Gary, but the original question was would an internal power supply
improve the RECEIVERS dynamic range, noise floor, etc.

I sure think the correct answer to that question was NO.

One reason I can think of for that being true, is that most internal
power supplies are better built by the manufacturers than a cheap
external power supply a user may use in some cases. If you use a good

quality external power supply, then the should be no difference in
reception.

Subject: FT530 programming

I have what may be a very unusual but interesting question. A few months
ago,
I encountered a lot of talk about whether memory settings could be cloned
from
one FT530 to another. I believe that the answer was yes and that it could
be
done through the 1/8" jack of the spkr/mic plug. Recently, Yaesu has come
out with the FT51R which is programmable (not just cloneable) through this
plug.
An I correct in assuming that the 51 programming software would work on the
530? What do you think?

From: dave@diusys.cms.udel.edu (Dave Dabell)
Subject: K-com filters and Telephone RFI

Yes, I've used a K-com filter on an at&t trimline-like phone (keypad in
the handset). This was a newer electronic model that had a volume level

switch for rcvd audio. It picked up rf bad enough to hear it across the room. After installing a K-com at the handset rf could still be heard, but it was less than 1/2 as loud as the voice at the other end of the line. Quite a reduction.
Inside the k-com is a torroid with maybe 30 turns of small gauge wire for each side of the line. So it appears to be just a choke. I assume it has quite a bit more inductance than you could get by wrapping the cord around a snap on choke.
Good luck with the rfi. If all else fails, you could always go back to an old ma bell model. They were pretty rf-proof.

Subject: KENWOOD RELIABILITY

Well Ed,
Out of 5 rigs (TS-440's) we bought, all five failed with the VCO glue. I fixed my own, the rest sent them in for repair. One has been repaired in other ways, but that's because N1JWR won't take the time to get his 13 W/M!!! And so the rig languishes, waiting for a warm hand to carress... but I digress...

My Kenwood 741 has stopped transmitting on the 6 meter module, and now the 2 meter module...

My guess is... they just arn't all that well designed, just adequate for the dainty ham operator. (I'm a HAM fisted 24 hour user...)

On the other hand, NOTHING I've ever owned didn't at one time or another need fixin. Ask me about the ICOM W2A...

Tom

Gary,

I bought a DSP-59+ a few weeks ago and have been very pleased with it. It does a great job on both CW and SSB, and the noise reduction works very well. You can hear your sidetone; just set the center frequency to your sidetone frequency.

QST didn't actually pan it for its noise, IMHO. Their review mentioned that you could hear some noise if you cranked the gain way up in the absence of a signal. The unit's noise is not noticeable at all in normal operation. I can hear a little bit of noise if I crank it all the way up with no signal input, but its noise is inaudible if I feed it audio from the receiver, even with the RF gain all the way down.

I'm not very impressed with most MFJ stuff, and from what I've heard, their DSP probably leaves much to be desired in both performance and workmanship. Just my $0.02 worth on Mighty Fine Junk.

Actually there are some advantages to the internal supply approach, but you're right, Tom - it has nothing to do with the location of the supply. Some of the internal supplies run significantly more than 12-15 volts, and this can be an advantage in some cases. Better IMD and spectral purity from the PA are easier to achieve at the higher voltages (28 to 30 volts) that these internal supplies offer. It's

also easier to make a 200 watt PA when it runs on 28v, which is why
the 200w output rigs generally have internal power supplies.

>some of that voltages gets back into the rig and confuses the display.

A resonant antenna can indeed need a transmatch. All resonance means
is that there's no net reactive component at the feedpoint. The
resistive component could be anything, depending on the particular
antenna geometry, and may need a transmatch to transform that impedance
to 50 ohms. In the case of a G5RV, it's longer than a halfwave
on 20 meters, 3/2-waves in fact. The feedpoint impedance should be
moderate, somewhere not too far from 50 ohms, but the G5RV is fed
with a 300 ohm balanced line section terminated into a coax. You're
not going to get 1:1 SWR on that balanced line (and probably not
on the coax either).

The fact that the line has SWR, however, has nothing to do with
RF in the shack. That's a balance problem, not a matching problem.
SWR on the line just means there are circulating differential
currents *inside* the line that form a standing wave pattern.
They can't get *out* of the line to cause a hot chassis unless
there is a system imbalance and parallel currents are flowing
on the *outside* of the coax. (From the point of view of currents
flowing inside coax, it is a balanced line. It's only for currents
flowing on the outside of the coax that imbalance is an issue.)

There are two kinds of balance involved here, physical and electrical.
Physical balance is important because the induction field can induce
a common mode current on the coax shield. Electrical balance is important
because it can upset the differential current balance of the feedline.

Physical balance is a matter of laying out the antenna and feedline
in a symmetrical manner, IE both legs of the antenna need to be mirror
images of each other with respect to themselves and to Earth, and the
feedline should be routed to bisect that symmetry.

Electrical symmetry is pretty much automatic if physical symmetry is
followed with regard to the antenna and the balanced line section.
The point where the coax attaches, however, can create an electrical
imbalance because shield currents can flow on both the inside and
outside of the shield at this connection point. This creates an
imbalance with respect to the currents flowing in the inner conductor.
A choke balun here (6 to 8 tight turns of the coax will do) will
restore the balance by stopping currents from flowing on the outside
of the shield.

>You might be able to make a virtual ground by attaching a 1/4
>wavelength (at operating frequency) piece of wire to the rig and just
>run it along the baseboard of the shack.

This may treat the *symptom*, but it doesn't address the cause.
A bilaterally symmetric antenna does not need a ground, virtual
or real, in order to perform properly. It's usually wise to
treat the brain tumor rather than just taking aspirn to suppress
the pain. Reserve grounds, virtual or otherwise, for feeding
asymmetric antennas like longwires. *They* need that current
mirror to replace the other half of their symmetry. If you
try to compensate for a hot shield with a balance wire, you
are still screwing up the antenna's design radiation pattern
since the feedline is now part of the radiating structure.

Antique Electronic Supply has new 826 tubes for $43.00 ea. + shipping...

But, I have 2 new Jan 826's new in the boxes...I'd let go for $65.00 for
the pair shipped.
If you interested, E-mail me & let me know.

From: dsnowden@ccd.harris.com (Doug Snowden)
Subject: 572B tube in Collins 30L1 ???

Subject says it. Will the 572B tube fit in the 30L1? Physically? It
might be a bit bigger than the 811A tube, I don't know. If it will
fit, is it electrically near the 811A? What is the result, more power?
More reliablity? Or a waste of money?

Along the same line, what is the advantage of using a ceramic based
811A as opposed to the bakelite based ones? I see RF parts advertise
the ceramic based ones at quite a bit more money..

From: "Manuel A. Maseda WF1J" <mmaseda@packet.net>
Subject: 572B tube in Collins 30L1 ???

Doug,

572B will work just fine in a 30L-1. You won't get anymore
power out but they will last forever. Collins recommends that
you change out one of the one of the caps in the 30L-1 for
best operation with a 572B but I've tried them with a stock
unit and it seemed to work fine. If your really interested in
this mod I can dig through my stuff and tell you which cap to
change.

As far as the ceramic based 811A, I've used bakelite 811 and
811A tubes for years and have never found any problems. I
wouldn't spend any extra for a ceramic base but if its the same
price, why not!

From: nepaleduc@aol.com (Nepal educ)
Subject: 800 MHz mod - C508A

Hi,

I have noted that my C508A picks up cellular conversations on the image frequency. The C508A first IF is 23.05 MHz, so my guess is that the images will be 46.1 MHz higher than the 870-890 MHz cell site outputs, ie 916.1MHz to 936.1 MHz. Set the frequency offset to 30 KHz and snoop away!

The image sensitivity is of course not good - I live on a hill and the S meter doesn't go to S9, but it seems better than having a mods butcher pulling such an intricate package apart!

Cheers,

Rob

From: brooney@aol.com (BROONEY)
Subject: Accuracy of Autek WM-1 at QRP

I was wondering whether anyone had any fact (or opinion) about the accuracy of this wattmeter at less than 5 watts. I have both QRP and regular 100 watt rig. Would like a wattmeter for both but accuracy at QRP level is most important. Or...do I need to get a QRP wattmeter (I understand Oak Hills has one).

Thanks

Subject: Someone wanted IC-2GXAT mods

Somebody was looking for mods for the IC-2GXAT about 2 weeks ago. Here are
the ones I know about:

IC-2GXAT mods:
1) Extended rx (136-180 Mhz): Hold down F-Scan-Duplex keys at same time
and turn radio ON. Or, cut diode D13 on logic unit.
2) Extended tx. Cut diode D14 on logic unit.
I have done the keypad mod for extended rx and it works without any mishap
to the radio. 73/Terry VE4UC

: >steve
: >KA5DLB
: >swdecato@nps.navy.mil

: Steve, are you sure the battery power is dropping off or is it the
: radio that is reducing the transmit power output? I believe the user
: manual states that when you use a high power batter pack or DC
: adapter, the radio may overheat from the higher power output and when
: it overheats, it automatically reduces its output power level. I have
: never had mine get hot enough to completely quit transmitting, but it
: sounds like that might be your problem. I hope this helps...73's
: Floyd WD5ENJ

I'll add my two-cents worth here. You are both partially right.
I have had my FT51R heat up enough to shift to low power and then
to stop transmitting. You will notice that it is in low power
because the transmit scale will be half or a quarter of what it
would be in full power. When it finally overheats, it will actually
stop transmitting. That is your red transmit light will switch
to green even though you have the PTT pressed.

Unfortunately, except for the blisters on your palms, the transition
to low power and then no power associated with over heating is
indistinguishable from the same transitions you would see if you
were on low battery.

To answer the original question, my understanding is that the EDC-12
is a trickle charge, but that it does not bypass the battery, so you
can at high power draw more current from the battery than it is putting
in. I use the bulkier PA-10A, which does give you full power bypass
and trickle charge.

I hope that helps, and by the way, has anyone come up with a heat sync
for this radio? I have a couple of drawings, but I don't know what
material to use. Currently, I have had some sucess wrapping an ice
cube in a paper towel, and rubbing along the back of the radio. This
works best if you remove the belt clip and use a speaker mike. I know
that this is unworkable for most folks, but it does work in a pinch.
As long as you keep the radio dry, you can pull a lot of heat out
of the radio in a few seconds.

Overloads easily, and has a terrible noise figure. Mutek (England)
has a replacement front end board that will fix this radio. I've
used it in a IC211, and it does wonders for strong signal handling
and for reducing the system noise figure.

You did not say how large a battery you wanted, which would help.
Assuming you are in the market for something other than palm sized you
should try Sears. They have a range of gell cells at attractive prices
available on special order from their auto centers. At least that's
what the flyer they were handing out at the last Miami Boat Show
indicated. Failing Sears, try West Marine or Boat/US. The 800
information operator can give you their numbers.

Subject: Yaesu FT51R

I bought one a couple of weeks ago. I haven't talked much on it, but I
have used it several times in a QSO with a friend on a repeater. On full
5 watts, it seems like it will be useable for at least twenty minutes of
back and forth talking. On the next lower power (3.5 watts, I think) it
seemed like we could just keep talking into the night. The back got a
little warm, but evidently not warm enough to do anything during the 1.5
to 2 hours I was using it.

Hi Victor,

My first thoughts are: Check to output and make sure your friends radio
is not putting out more than 5 watts..... Also if the temp in the Car
is really hot, the radio will reduce power earlier.

FYI and 73's

Steve, are you sure the battery power is dropping off or is it the radio that is reducing the transmit power output? I believe the user manual states that when you use a high power batter pack or DC adapter, the radio may overheat from the higher power output and when it overheats, it automatically reduces its output power level. I have never had mine get hot enough to completely quit transmitting, but it sounds like that might be your problem. I hope this helps...73's

1153. Batt voltage on FT-51R

Newsgroup: rec.radio.amateur.equipment
Date: 1995-08-28 00:00:00 UTC
From: tigger@jcomm.uoregon.edu
Message-ID: <41rqom$sri@maureen.teleport.com>
Source record: 213291

In the manual it says to display the battery voltage while you transmit (I am assuming that this means it will display it out in the VFO or the memory channels) you need to press the sub-op button before doing the procedure to view the battery voltage (the f-key then 0, dial until you get option 25-batt vol) then press 0 instead of PTT. I have done this many times and it seems just to go back out to the memory channel or VFO, which ever I was in last. Has anyone who owns a Yaesu FT-51R gotten this to work?

Thanks

Max

This mod gives you extended transmission range on a Yaesu FT-11R.

I have knowlege that this mod works, but take no responsibility for any
damage it does to your radio, the legality of this mod, or any other
incurred damages.

After the mod a FT-11R will have:

Recieve: 110.000-135.995 (AM) 136.000-180.000 (FM)
Transmit: 136.000-180.000 (FM)
Empty Memories and a completely reset radio

First, Remove the antenna, battery pack, and pocket clip (if installed)
from the radio. Then remove the four black screws from the corners of
the main section of the radio, the two black screws from the bottom center
section of the main body, and the two silver screws from the bottom of the
keyboard section. Now carefully separate the back and front halves of the
radio, taking care not to put too much strain on the internal ribbon cable,
or loose the small metal strap holder or the battery release button.
Once you have opened the radio, carefully remove the metal plate covering
the back of the keyboard. Then remove the "AF" pcboard by first removing
the two copper screws in the middle of the board, then holding the bottom
of the pcboard and the mic/speaker jacks between your thumb and forefinger
and pulling straight up. This may take a little force, as you are

seperating two connectors. Once you have the "AF" board removed, set it and the connector/keyboard backplane board aside. Now look at the lower left corner of the controller board. You should see the 8 jumpers (they are very small), set up like this:

Top of radio

L A o-o o o E I don't know how the jumpers relate to the
E B o-o o o F ones on the schematic, so the letters are just
F C o o o/o G for reference in this article
T D o-o o o H
"-" means a solder jumper, and "/" means resistor

These are the functions of the jumpers that I know of:
A- Turns your radio into the euro version (TX between 144.000-146.000)
B- ?
C- ?
D- This is the important one. Gives you extened TX range
E- Turns your radio into the 440Mhz version. Not Suggested!
F- ?
G- ?
H- Same as jumper "E"

The only jumper that this mod deals with is "D". It currently has a solder jumper across it. Remove the solder across the jumper with really small solder wick or a desoldering station, taking care not to touch any plastic with your soldering iron. Once this solder jumper is removed, you now have extened tx range. Now carefully replace the "AF" board first, and then the connector/keyboard backplane board. Take care to get the copper grounding connector on the side of the mic/speaker jacks well seated. Replace the two copper screws in the middle of the "AF" board, and the two silver screws on the bottom of the keyboard. Replace the battery eject button and strap holder, and then replace the back half of the radio. Replace all the screws, put the battery and antenna back on, and turn the radio on. You should see 144.000 on the screen. Turn the radio off and the hold the MHZ/\ and MHZ\/ buttons while turning the radio on. You now have the transmit range between 136.000-180.000.
As a suggestion, you can store completely different transmit and recieve frequencies in a memory (see manual), so if you store a service frequency in a memory, you can program a legal HAM frequency as the transmit freq. so you never accidently transmit on an illegal frequency.

Another neat feature that I have found on these radios is the "Clone" feature. You can transfer all memories from one FT-11R to another FT-11R. First, make a cable using two male stereo 1/8" connectors,
and connecting the top(gound) and middle conductors of the plugs straight through. Don't connect the tip conductors together though. Plug this cable into the earphone jacks of the two radios, and on each radio, hold down the "FM" button while turining it on. You should see every character flashing on the screen. Now, on the radio which you wish to recieve the memory contents from the other radio, press the MHZ\/ button. You should see

"RX CLN" on the screen. Then on the radio which is to send it's memory
contents, press the MHZ/\ button. "TX CLN" should appear on the screen for
about 5 seconds, then it should return to the flashing screen state. The
recieving radio should now be in normal operating mode. Turn both radios
off, and remove the cable. That's it. This function overwrites all of
the recieving radio's mem contents, and copies everything from memories
to pager codes to the status of the light. WARNING: The instant that you
hit the MHZ\/, your memories are GONE, even if the transfer is unsuccessful!
Also, both radios must have the same jumper settings to successfully
complete the cloning process.

That's all I know for now! Have fun!

Any other questions? Contact me at "ijordan@freenet.fsu.edu"

>should consider something else. Thanks in advance.

Like most things, it's more a matter of preference and opinion than cold hard fact as to which keyer and paddle is best. My preference is a vibroplex iambic paddle and any curtis 8044ABM based keyer. The Curtis 8044 chip is an application specific device that most keyers (including the MFJ you describe, I think) are utilizing. I was heavily into mobile CW for a while and found the BENCHER paddle would "pop its' spring" if I accidentally dropped the keyer off of the front car seat. I like the vibroplex 'cause it is VERY HEAVY and doesnt slide around.

Source record: 213294

I have found the K-Com filters quite effective when installed per directions and recomendations. There are 2 types with different frequency ranges (medium frequency and HF). They work well on common mode currents.

Antenna systems running moderate to high power close household wiring doesn't help. Try moving antennas away from house if possible. Or, be prpaired to buy several pounds of snap-on ferrites!

tuck@europa.com wrote:
>I operate CW most of the time and am interested in either the Timewave 59+
>or MFJ 784B. Any advice? The areas of most concern are:

It seems to me that the responses you have received pretty much tell a tale of their own .. that is, that not everyone likes the same piece of equipment.

Everyone has their own reasons for liking one box over another. And of course, whatever they have ended up with is "the best". I ran an NIR-10 and the older DSP-59 (no "+") side by side for months. Sometimes one was "better" than the other in some specific respect on that day with those band conditions, sometimes the other way around. Every one of the boxes is a compromise one way or the other -- if they weren't, you and I couldn't afford to buy one. I finally parted with the NIR-10, but not because it was a crummy product -- only because for MY needs, the DSP-59 represented a better set of compromises. I currently use a DSP-59+ and I'm happy with it, but I'm also itching to get my hands on an NIR-12 to see how that one plays.

The early MFJ "Super DSP" was really crummy in a lot of ways. Tried one briefly and moved on quickly! Sounds like they may have improved things in the "B" version.

You'll never know which one is best for you unless you try them all side by side. So the way out is to pick one and run it for a while and see if YOU like it. 'Cuz what I like, or what somebody else likes may not be what you're gonna like.

And you'll always wonder if the grass might have been greener with the one you didn't buy :-) :^} ....

In article <tuck-2308951638490001@walkingstick.europa.com> you write:

>I operate CW most of the time and am interested in either the Timewave 59+

I have the Timewave DSP-59+.

>Does the unit generate its own noise? This is really irritating when I
>use an AF to filter out faults in the receiver (hiss, AGC pop) as well as
>for selectivity. I listen with headphones. QST panned the 59+ in this
>area.

There is a little digital noise, barely noticeable with the radio volume turned all the way down. With any radio noise or signal, it either goes away or you don't notice it.

>How does the unit handle CW spotting? Can you hear your own sidetone if
>it's the same frequency as the received signal?

Yes, presuming the sidetone is loud enough to be heard above the received signal/noise. Also, if you're using bandwith filtering, pressing a button generates a tone at the center frequency. Since my rig's sidetone is fixed at 800 Hz and I prefer 600, I set my RIT to a pre-marked place and use the Timewave's tone. You can set the unit up to bypass on CW transmit, so your sidetone comes through even with narrow filtering on a different frequency.

>How well does the noise reducton feature work?

Incredibly well. I can actually stand to listen to 75m SSB (well, the signals, if not the content. . .). The noise reducer is less effective on CW, but still noticeable. But you almost don't need it on CW. If you narrow the bandwidth to 100 Hz or less, you get rid of so much noise it's unbelievable, with no ringing.

On RS-10/12/15, I use both narrow filtering and noise reduction, and it helps. Interestingly, my Icom 745's IF noise blanker gets rid power line/impulse noise better, and the Timewave seems better at general atmospheric crud, so I use 'em both as needed.

I've been a ham for 26 years, and the Timewave is the first thing I've bought in a long time which was a truly revolutionary change for the better.

I just copied this from one of the ham forums on CIS if anyones interested:

**** ICOM America, Inc has annonced to dealers on August 25, 1995 ****

We expect to start shipping the IC-706 to the dealers on
September 27 - 29, 1995.

The following is a listing of retail pricing for the IC-706 and some accessories.

IC-706 Transceiver $ 1560.00
CR-502 High Stablity Crystal $ 76.00
MB-62 Mounting Bracket Main Unit $ 20.00
MB-63 Mounting Bracket Ctrl Panel $ 14.00
OPC-581 3.5 M Seperation cable $ 48.00
OPC-589 8 pin to RJ-45 adaptor $ 28.00
OPC-598 7M AT-180 Extension cable $ 58.00
OPC-599 7 & 8 pin to 13 pin cable $ 48.00
UT-102 Voice Synthesizer $ 59.00

This is all I have pricing for at this time. I will update this list as I receive the information.

I am reluctant to put in my 2 cents worth, but I just sent my YAESU FT-736R back to Yaesu to install the 9600 Baud capability. They installed it, tested it, and sent it back working just fine, Furthermore, since it is a feature new satellite transceivers have, and since it is still under warranty, they did it for free! Anyway, I called them up first to get instructions. This is what they said: "Include receipt, letter of repairs, return shipping address, and the sender's telephone." Send it to YAESU Service Department, YAESU USA, 17210 Edwards Road, Cerritos California 90701-2459 Their phone number is (310) 404-2700. The above information is from their service receipt, but I suppose I used the same address when I

sent the FT-736R to them via UPS. I hope this adds to clarity and not confusion. 73 de KC7EMC

I won't get into the comparison here since I'm obviously biased, but
keep in mind that the top-of-the-line model from JPS is the NIR-12, a
dual-DSP unit featuring two different types of noise reduction -
adaptive peaking *and* spectral subtraction. The NIR-12 was introduced
at Dayton this year. There is a data sheet and a photo on the JPS web
page at

I'd give consideration to the Yaesu FT-51R. My wife passed her Tech. last weekend, and I was able to get her callsign off the UALR callsign server yesterday, so you probably won't be waiting too long, depending on how quickly your VE team forwards the paperwork.

Anyway, she likes the 51R because of its small size. It can also be programmed via Windows with the optional software and interface cable.

Handhelds for the 220 MHz band are getting harder to find; someone still does make a 2M/220 handheld, and I can look up that info. if you like.

Number of memories is a definite consideration. Not knowing where you live, i can't comment on the repeater density. I have a Radio Shack HTX-202, and that's the only complaint I have. It has only 12 memories, and I have almost 40 repeater frequencies for 2M/440 programmed into my scanner for this area.

If you will be using more than one repeater, scanning would be nice to have. In conjuction with that, you may want extended frequency receiving capabilities (i.e. it can be used as a scanner outside the ham bands) but be aware that this increases susceptibility to intermod.

You'll definitely want CTCSS encoding capability, but this is usually standard. I've been considering the Icom IC-3SAT for 220, and it is optional.

Size, weight and power output may also be important to you.

I'm sure that others will give you some good ideas.

73, and welcome to the amateur fraternity!

Jim

: (R.S.). However, by removing inxxxx the NiCad pack and re-inserting,
: the msg. goes away & functions are normal. Any idea what's causing
: this on a fairly new (6 mos.) HT?

Typically, this will happen when you use the rubber duckie, and the
alkaline battery pack, or an external power source - the RF gets into
the HT via the keypad. If you're getting it with an external
antenna, however, you may want to send it back and have it checked out.

Subject: 2m/70cm Handheld Reccomendations ?

>>I just passed my no-code yesterday...

Congratulations!!!

>>... and am looking to purchase an 2m/70cm handheld.

We're the WORST group to ask for equipment recommendations! We're much too biased.

I would like to advise you to join your local Amateur Radio club. They can provide you with HANDS-ON experience with many units.

Then, after you have performed all your research, you will independently discover that the Standard C558a is one of the finest HTs you can buy.

<grin>

From: herbr@netcom.com
Message-ID: <herbrDE1r63.5tp@netcom.com>
Source record: 213210

I am interested in purchasing a new HF transceiver in the $1500 price range. I am looking very closely at the Kenwood TS850. I would appreciate hearing any comments our opinions on this radio and / or comparison to any other HF radios in the same price range.

Also, on the TS850, is the build in antenna tuner any good? Is it broadbanded to tune up a G5RV, for example? What about the other assories like the station monitor, filters, etc? Any comments?

Thanks and very 73's.

I have 2 Motorola Expo 2 channel UHF HTs' that I would like to sell.
They are currently set up to a commercial repeater on channel #1, and
talk-around on channel #2.

I would like to sell the whole package for $200 plus COD shipping (UPS).
The package includes the following:
-2 radios with batteries and antennas
-rapid rate Motorola charger
**The radios have belt clips on the back of them...no need for
expensive leather cases.

If interested, please feel free to contact me at the following address:

Got this off CIS tonight. It was posted by someone from Icom support:

**** ICOM America, Inc has annonced to dealers on August 25, 1995
****

We expect to start shipping the IC-706 to the dealers on
September 27 - 29, 1995.

The following is a listing of retail pricing for the IC-706 and some
accessories.

IC-706 Transceiver $ 1560.00
CR-502 High Stablity Crystal $ 76.00
MB-62 Mounting Bracket Main Unit $ 20.00
MB-63 Mounting Bracket Ctrl Panel $ 14.00
OPC-581 3.5 M Seperation cable $ 48.00
OPC-589 8 pin to RJ-45 adaptor $ 28.00
OPC-598 7M AT-180 Extension cable $ 58.00
OPC-599 7 & 8 pin to 13 pin cable $ 48.00
UT-102 Voice Synthesizer $ 59.00

This is all I have pricing for at this time. I will update this list
as
I receive the information.

AHA! I think there should be. If you must be lisensed to xmit, why not be lisensed to buy? I realize that my own situation would change as my fiance bought me my first rig, but hey, compromise is key.

In SCUBA, you can buy all the equipment you want, but you cannot buy compressed air or an air tank without a "C" card. perhaps we need the same enforcement in HAM.

Jeff,

I don't have an FT-51R, but I suspect you cannot hear stations in the
FM broadcast band because FM broadcast signals use 75-kHz deviation,
as opposed to the 5-kHz deviation used for amateur NBFM signals. Unless
there is a separate filter for the broadcast signals, you won't hear
anything.

73,
Jeff, KC1MK

Most mail-order places have gel-cells but maybe expensive for the
higher quality cells.

I have a large number of new (sealed in package) Gates Cyclons:
48V/8Ah (in a 2"hx11"deepx16"wide steel enclosures), these
be broken down into 12V/8Ah and 6V/8Ah. I also have 12V/5Ah
(individual E cells in a white clam-shell. Can be rewired for
any voltage between 2 and 12 [multiple of 2]).

Datecoded 12-94.

If anyone needs some....

john

Check your local industrial or electrical supply wharehouses.
Gelcells are commonly used in emergency lighting and alarm systems,
and are usually available at these sorts of places. They tend to be
wholesale oriented, but many will sell retail. Pick up the yellow
pages and call around.

I need to replace the antenna on my FT-530. Does anyone know of a third-party rubber duck that meets or exceeds the performance of the Yaesu original? I was always pretty impressed with the factory duck, but there's no time like the present for an upgrade, right?

Thanks,
Jim

I have the Yaesu FT-51R. This is a VERY good radio. I like mine
very much. I have a friend who purchased one on my recommendation
and he is equally happy.

I've had good luck with a Kenwood TH-77. My suggestions:
- Used equipment in good shape is a better deal than buying new. Buy
locally if you can. Bring a friend along. Also scan the net to
get an idea on prices.
- Make sure it can receive on both bands at once. The TH-77 can send
audio from one band to a speaker-mike, with the other to the built-in
speaker. Some so-called dual-banders can only recieve on one band
at a time.
- Just remember it's an HT, not a mobile. They generally have intermod
problems when attached to a decent antenna.

1200. Background noise using HTX-202 mobile

Newsgroup: rec.radio.amateur.equipment
Date: 1995-08-29 00:00:00 UTC
From: Allan Spitzer <aspitzer@ccmail.gsfc.nasa.gov>
Message-ID: <41vv0s$mh9@post.gsfc.nasa.gov>
Source record: 213233

During recent qso's from my car, I have been told that I have a lot of background noise. The noise sounds like I have the windows open even though I do not. The noise disappears when I stop the car, even if the engine is still on. I am using an HTX-202 with a 5/8ths wave mag-mount.

I was thinking about trying an external mic, but I have a sneaking suspicion that the noise is engine related (the car is new Civic).

Any suggestions would be appreciated.

Thanks,

Allan N3TCM

>The PA-10 with a built-in fan was discontinued due to slow sales and
>high price. The PA-10A (without a fan) replaces the PA-10 with a lower
>price. Also the new E-DC-12 works great for it's low low price.

Personally, I think it is a shame that the PA-10 needed to be so
expensive, and they now only sell the PA-10a. What does a simple fan
cost for Yaesu? The fan is the ONLY difference between the PA-10 and the
PA-10a. Instead of selling a usefull option that the competitors don't
have, for a reasonable price, they cripled the PA-10 to 'justify' the
lower price! Come on Yaesu! Put that low cost fan in it and add it to
the price of the unit, and continue to sell it! You will sell a lot more
PA-10's if they are just $ 5,- more expensive but contain the fan! And
then you have something that your competitors don't have. Yaesu, are you
listening?

However, don't dispair. There is a solution!
The PA-10 may have been discontinued, but the PA-10a is still available.
It contains the ventilation holes, fan mount, etc. It just misses the
most usefull component: the fan itself. I bought a PA-10a and mounted a
fan in it myself. Just a standard size 40mm fan that is everywhere
available. It fits exactly on the fan mounting holes. The only thing you
need to modify is the heat sink (for the transistor that brings down the
voltage to 11.5 volts). You need to cut of the upper part of it. Since
the unit has now a fan, the heat sink doesn't need to be that large
anymore. I even doubt that the heat sink had to be that large anyway, it
looks like they wanted to fill in the space of the fan, to avoid that it
is to obvious that you can easily mount the missing fan there yourself.

I powered the fans at the 11.5 volt output to make them input voltage
independant, via a series resistor of 22 ohm. The latter is to minimize
the 'noise' of the fan. It doesn't need to run at full speed.

Anyway, I have two modified PA-10's now, one in my car, and one as a
base unit. Both work flawless and the handheld doesn't get hot anymore,
even not after lengty QSO's at full power. They work very convenient:
just snap in the HT, and it is fixed firmly in place, even if your
extension microphone pulls on it, and if you need to take the radio,
grab it out with just one hand.

Without the PA-10, the radio isn't the same anymore. It falls on its face all the time if you use the extension microphone, it runs hot and suddenly stops transmitting, etc.

Another modification I made was to replace the built in trickle charger by a fast charger, using the ICS 1702 chip. It avoids memory effects also and doesn't overcharge the batteries like the trickle charger does.

Why doesn't Yaesu sell a decent mount, with a fan, and a charger that doesn't slowly destroy the batteries? The FT51r is a great radio, but it lacks some good accesoiries. It looks like the accesoiries are designed by a different company than the radio itself. The radio contains all features that you can think off, but the accesoiries appear to have not been tested in the 'real world' and are not even used by Yaesu itself.

1203. YAESU 747 acting up

Newsgroup: rec.radio.amateur.equipment
Date: 1995-08-29 00:00:00 UTC
From: Bill Harwood <harwood@sirius.chinalake.navy.mil>
Message-ID: <DE375t.Ln2@avalon.chinalake.navy.mil>
Source record: 213236

My YAESU 747 started acting up a few days ago. Does anyone have any ideas or seen this problem.

INSTALLATION: The 747 is in a remote head configuration. The radio is in a camper shell on a pickup truck (FORD RANGER) and I am in the Mojave desert so it gets real hot back there. I have not seen this problem in the previous three summers. The antenna system is a SPIDER with 7 resonators feed through an SGC-230. There does not appear to be an SWR problem or output power problem

SYMPTOMS:
1. The SWR/S-meter starts jumping on receive like there were a close by AM-CW signal interfering.

2. The audio level goes down and then eventually goes away. No audio at all.

3. Sometimes keying the mike will return the radio to normal function for a short time (this is SSB mode with no modulation to speak of).

4. Sometimes the radio will not transmit power. It shows transmit mode (light) but no output power.

5. Turning the radio off for a few minutes seems to return the radio to normal function and then the cycle starts over again.

6. It does not seem to have the problem at night.

It sounds like a thermal problem and I am guessing that there is a component like a capacitor gone marginal but I canï¿½t locate a good candidate on the schematic so I am looking for anyone with a similar experience.

Thanks,

Bill Harwood

Hi,
I am looking to buy a replacement Repeater Controller to replace our lightning struck ACC-RC85 controller.

Since ACC is out of business we decided to shop around for a controller.

We have finally narrowed our search down to the CAT-1000 controller from Computer Automation Technologies in Florida.

Any body used their controllers before ???

If you have any comments I would like to hear them.

Thanks in Advance,

Suresh N9GSA

Jeff Sumberg asked about the display on a Heathkit HO-10 scope:

> When the scope is in operation, the trace appears as a broken line
> rather than a solid line from edge to edge.

I don't understand why you suspect trouble in the vertical deflection system, since you described amplitude modulation, not vertical deflection, of the spot.

I would first guess that you have hum on the CRT's control grid, or earlier in the amplification chain.

And the first place I'd look for that hum is in the power supply: the electrolytic filter capacitor may have become defective in its old age.

I"m about six months ahead of you getting my technician and addressed
the same issue. After talking with older and greyer HAMS, I opted for
an ICOM W-31A. My rationale:

1) A lot of my traveling is at night so I wanted a lighted keypad. This
almost forced me to the ICOM line.

2) Memories: I travel a lot to a home in New Hampshire and a workplace
in Virginia. I've my ICOM programmed for both places, as well as home
base in Owego NY. I needed a lot of memory in order to do this. The
IC W-31A has fifty memories for each band.

3) I didn't want a detachable mike/keypad as it made the keypad smaller
and I"m "fat fingered".

4) Accessories: I also purchased the cigarette lighter adapter to give
me unlimited power supply (and 5 Watt transmit as well) and a "hot rod"
antenna to help ensure that I "get through" in emergencies.

1213. Yaesu FT-11R Mods Request

Newsgroup: rec.radio.amateur.equipment
Date: 1995-08-29 00:00:00 UTC
From: clint.bradford@woodybbs.com
Message-ID: <93.4070.7583.0NFBAF9F@woodybbs.com>
Source record: 213246

Subject: Yaesu FT-11R Mods Requested

>>...extended TX mods for the Yaesu FT-11R...

From ATTENTION to Details BBS 909-681-6221:

This mod gives you extended transmission range on a Yaseu FT-11R.

I have knowledge that this mod works, but take no responsibility for any
damage it does to your radio, the legality of this mod, or any other
incurred damages.

After the mod a FT-11R will have:

Receive: 110.000-135.995 (AM) 136.000-180.000 (FM)
Transmit: 136.000-180.000 (FM)
Empty Memories and a completely reset radio

First, Remove the antenna, battery pack, and pocket clip (if installed)
from the radio. Then remove the four black screws from the corners of
the main section of the radio, the two black screws from the bottom center
section of the main body, and the two silver screws from the bottom of the
keyboard section. Now carefully separate the back and front halves of the
radio, taking care not to put too much strain on the internal ribbon cable,
or loose the small metal strap holder or the battery release button.
Once you have opened the radio, carefully remove the metal plate covering
the back of the keyboard. Then remove the "AF" pcboard by first removing
the two copper screws in the middle of the board, then holding the bottom
of the pcboard and the mic/speaker jacks between your thumb and forefinger
and pulling straight up. This may take a little force, as you are
separating two connectors. Once you have the "AF" board removed, set it and
the connector/keyboard backplane board aside. Now look at the lower left
corner of the controller board. You should see the 8 jumpers (they are very
small), set up like this:

Top of radio

L A o-o o o E I don't know how the jumpers relate to the
E B o-o o o F ones on the schematic, so the letters are just
F C o o o/o G for reference in this article
T D o-o o o H
"-" means a solder jumper, and "/" means resistor

These are the functions of the jumpers that I know of:
A- Turns your radio into the euro version (TX between 144.000-146.000)
B- ?
C- ?

D- This is the important one. Gives you extended TX range
E- Turns your radio into the 440Mhz version. Not Suggested!
F- ?
G- ?
H- Same as jumper "E"

The only jumper that this mod deals with is "D". It currently has a solder jumper across it. Remove the solder across the jumper with really small solder wick or a desoldering station, taking care not to touch any plastic with your soldering iron. Once this solder jumper is removed, you now have extended tx range. Now carefully replace the "AF" board first, and then the connector/keyboard backplane board. Take care to get the copper grounding connector on the side of the mic/speaker jacks well seated. Replace the two copper screws in the middle of the "AF" board, and the two silver screws on the bottom of the keyboard. Replace the battery eject button and strap holder, and then replace the back half of the radio. Replace a the screws, put the battery and antenna back on, and turn the radio on. You should see 144.000 on the screen. Turn the radio off and the hold the MHZ/\ and MHZ\/ buttons while turning the radio on. You now have the transmit range between 136.000-180.000.
As a suggestion, you can store completely different transmit and receive frequencies in a memory (see manual), so if you store a service frequency in a memory, you can program a legal HAM frequency as the transmit freq. so you never accidentally transmit on an illegal frequency.

Another neat feature that I have found on these radios is the "Clone" feature. You can transfer all memories from one FT-11R to another FT-11R. First, make a cable using two male stereo 1/8" connectors,
and connecting the top(ground) and middle conductors of the plugs straight through. Don't connect the tip conductors together though. Plug this cable into the earphone jacks of the two radios, and on each radio, hold down the "FM" button while turning it on. You should see every character flashing on the screen. Now, on the radio which you wish to receive the memory contents from the other radio, press the MHZ\/ button. You should see "RX CLN" on the screen. Then on the radio which is to send it's memory contents, press the MHZ/\ button. "TX CLN" should appear on the screen for about 5 seconds, then it should return to the flashing screen state. The receiving radio should now be in normal operating mode. Turn both radios off, and remove the cable. That's it. This function overwrites all of the receiving radio's mem contents, and copies everything from memories to pager codes to the status of the light. WARNING: The instant that you hit the MHZ\/, your memories are GONE, even if the transfer is unsuccessful! Also, both radios must have the same jumper settings to successfully complete the cloning process.

Man, does that sound familiar. Besides myself, I know 3 other guys who bought kenwood ts440s's (late models), and EVERY friggen one of crapped out the same way. I fixed mine once, and then had kenwood fix it. Sam damn thing. One would think that all radio manufactures would know how to make a pll by now. Guess not.

>
>On the other hand, NOTHING I've ever owned didn't at one time or another
>need fixin. Ask me about the ICOM W2A...

True enough. I just wish my jap radio equipment was HALF as reliable as my wife's Kenmore washing machine. After the adventures with my '440, I have decided to make that my first, and last Kenwood. The next biggest piece of crap I own is an Icom 04/at. Yet even more PLL problems. I can promise this, the next hf radio I buy will in all likelyhood be a TEN-TEC.

BTW, Our little group of ham guys gets together almost every Saturday night, and we have a long-standing joke that refers to the one of the guys "DEAD RADIO COUCH" down in his basement /radio room. Pretty funny stuff. That sucker was loaded about 2.5' high last year with a wide variety of broken Kenwoods and Icoms. Ahhh, guess you had to be there.

>Tom

Hi Tom, I too have tried several computer logging programs. I assume you are interested in the casual day-to-day logging, not contest logging. For casual daily QSO's, I've found HYPERLOG (TM) to be a superb logging program. I believe
version 2.24 was a "testware" program that allowed free testing for a period of time. If you like it, it can be purchased for 49.95 or something there abouts.

Features I enjoy: shows prior QSO's with a station that you've worked before, date, time, band, etc. Shows QSO's with that country before. Automatically tally's DXCC and WAS by band, by mode. Has default settings for power-up (I enjoy 17 mtr CW, so it automatically comes up in that mode. Setup option allows me to store long/lat data of my qth and shows the lp and sp and distance to the country being worked. Print function is decent. Does QSL labels.

Though it's not totally free, it is worth 50-bucks (their advertisement says "less than a hundred foot roll of RG-8 coax). Anyway, some 4000 QSO's later, I still am using the HYPERLOG software. No, I have no affiliation with Hyperlog in any way. A friend in JA introduced me to the software after trying something called DXB (did not like it). Just a pleased customer.

My experience is that the built in antenna tuner will tune almost anything.
I have a 20 metre dipole up, and the antenna tuner will give me what looks like
1:1 on 80,40 and 15. Doesn't work very well, but the finals see 1:1 <G>.

I also tried it on the new bands, but no go there....

>hundred milliseconds)?
>
The TM-742A unfortunately does not support a sampling of the control band,
however there is a way around your problem, if you can get the cooperation of
the repeater owner(s).

If you can convince the owner of the repeater to put a CTCSS (P.L. or Channel
guard for the Motorola / G. E. types out there) encoder on the _output_ of
the repeater, keyed by the COR so that the tone is only present when there is
someone transmitting on the _input_, then you will be able to break in without
waiting for the 'tail' to drop. This will also require that you get the
optional CTCSS Decode board for the '742A. With this arrangement, when a
station keys up the repeater, it will transmit a sub-audible tone which
will bring up the 'control band' TX on the '742A. As soon as that station
stops transmitting, the tone will stop and the decoder on the 'operating band'
of the '742A will turn off and the '742A will stop transmitting. This will
give you a window to get in before the next station transmits.

There is one small downside to this setup. You, listening on your HT will not
hear the repeater's courtesy tone and must be aware of whether or not your
HT is receiving your '742A transmitter. If you try to transmit while your
'742A is still transmitting, you will not get through until it stops. Not a
big deal, but something to be aware of.

herbr@netcom.com (Herb Rosenberg) wrote:
>I am interested in purchasing a new HF transceiver in the $1500 price
>range. I am looking very closely at the Kenwood TS850. I would
>appreciate hearing any comments our opinions on this radio and / or
>comparison to any other HF radios in the same price range.

I have owned many rigs in the last 5 years. I just love playing with the new knobs I guess. Which rig's well lets see: TS-830S, TS-850S/AT, TS-940S/AT (QTY 2), FT-1000D, FT-900/AT, FT-890/AT, IC-725, IC-735, and several Hand Helds and mobile VHF/UHF rigs.

The best NEW rig that can be had for $1500, IMHO is the FT-900/AT, but if you do not mind buying used, buy the FT-890/AT. That rig is great! Small box, great receiver and noise blanker. All the features of the TS-850/AT except for the memories. That I would say is the only negative aspect of the FT-890. The FT-900 is a great radio also, but I really feel that the 890 is a better rig over all, and if you don't plan on using it as a PERMANENT mobile rig, than the 890 WINS!

Now the Kenwood TS-850 is a fin radio and don't get me wrong on this, I do not mean to cut it short, but the FT-900 and 890 will out perform the Kenwood on a side by side test. I have done it and I am convinced.

What is one of my all time favoite's, The Kenwood TS-940S/AT with a few mod's applied. Like the Geihl firmware update, and the IRCI 2.1Khz SSB filters. That rig is great once you fix up the cooling fans in it. They tend to break down and get noisy after about one year of operation. Best fix I have heard of is to replace them with PC type 12 Volt muffin's. Although I have not personally done this, it sounds like a good Idea.

I am using the FT-1000D at the home station now, and it is really the greatest radio I have ever owned, but good God it is expensive.

73 and I hope this helps.

Source record: 213061

My interest in 6m is growing.....thought I'd throw out a few questions going through my mind.

Is a multi mode 6M rig worth the expense(when I don't have an HF rig that will take a 6M model) or do most just work FM?
Do most just work simplex, or work repeaters?
Do operaters on 6M have problems causing interference on the TV frequencies?(I've heard that used to be a problem)
Why do many 6M Rigs only operate on 10 watts?
I probably can't afford to get into 6M right away, but research dosen't cost too much!

:>>>These is no law that requires you to hold an Amateur license for
:>>> purchasing an Amateur radio transceiver.

:>AHA! I think there should be. If you must be lisensed to xmit, why
:>not be lisensed to buy? I realize that my own situation would
:>change as my fiance bought me my first rig, but hey, compromise is
:>key.

Your eminence, Lord GAD:

[Here we go again with this thread] ;-D

Have you thought about the ramifications that would exist if what you stated came to be? Nearly every ham who holds a Novice thru Advanced class ticket would not be able to purchase an HF rig that covered the entire amateur HF spectrum. Since they are not licensed to transmit in the next higher class' of license subband they [according to your statement] should not be able to purchase such a rig.

And a Novice operator would not be able to buy a two meter radio.

Think about it. It's not up to us [as hams] to determine who can and cannot own or purchase a radio. After purchase it is between the buyer and the FCC if the radio gets used. Unless of course you are appointing yourself an operation police person. Then YOU can run around and check to make sure that stores are selling xmitting equip only to licensed individuals.

Otay?

Does anyone know a GOOD loggin program for ham radio. I know there are some out there, but I'm having bad luck getting one. I recently bought a CD-ROM that had no less than 15 logging programs -- none of them worked! I'm not too anxious to part with green money again until I know what I'm getting in advance!

Does anyone have one that they are really in love with? If so, why the love affair!

Thanks,

Tom

Brian,

I've had personal experience with an R-5 and an R-7 at my previous residence, and a Mosley TA-33 jr. (4-element 5-band) yagi and then a KLM KT-34 (4 element triband) beam, with inverted Vees for 40 and 80 meters at my current location. Of course the beams outperformed the R-5 and R-7 on 10-20 meters as you would expect, but the R-7 is better overall on 40 meters than my inverted Vee setup. Another advantage about the R-5/R-7 is that you don't need to get them very high off the ground to perform well. 10 ft. off the ground and free of any close obstacles is fine.

The only drawback I can see about the R-7 as compared to the R-5 is that it is not as broad-banded on 20 meters. (The R-5 is almost flat throughout 20 meters).

I think you pretty much can't go wrong with either the R-5 or the R-7. They're both It's a good overall antennas, and the R-7 is especially on 40 meters.

Feel free to contact me via e-mail if you wish to discuss it any further.

I owned a TR-33 right after they first came out. It is FM only, and I do not remember the exact power, but it is only a couple of watts. It is xtal control, but uses only one xtal for the repeaters. You buy the xtal for the receive freq (i believe) and the radio has the ability to offset that for xmit. I liked the radio, but then I also like the TR-22. Wish they would sell something like that again.

Hello,

I've got an all mode 2 meters transceiver Kenwood TM 255E.
It has a very efficient reception.
But sometimes the output power decreases suddenly (to only the half nominal power), where as the VSWR of the antenna does not exceed 1.2 (it happens even on a dummy load !!) and moreover the linear amplifier is not really hot. So I suppose that there's a problem with the thermal protection or the SWR protection but i'm not sure.
If someone else has the same problem and may be has found the solution :

This is because the radio has a feedback circuit which measures the power output (actually it often measures the RF voltage output), and adjusts the RF drive to the power amplifier module to achieve the set amount. On the high power setting, the feedback loop cannot achieve this unless, obviously there is enough DC voltage to allow the amplifier to reach 5W output. The exact point where the feedback circuit starts to reduce the power depends on many factors, in this case it was 10.4 V. Probably most HT's are designed to fall close to this number, as the '5 W' NiCd pack supplies only 12.0V, not 13.8 or more that can come from a vehicle's electrical system.

> BOTH THE RF OUTPUT AND CURRENT DRAIN REMAINED CONSTANT AS THE
> SUPPLY VOLTAGE WAS INCREASED FROM 10.4 VDC TO 13.8 VDC.
>
My tests with the power amplifier from a Motorola Mocom radio tended to show that the amount of heat produced is controled primarily by the supply voltage and not the power output. In other words, reducing the RF output by reducing the RF input to the amplifier caused the DC input current to drop, but the "excess" DC input power (DC power - RF power) remained almost constant.

This is somewhat confirmed by your numbers above:
Medium power: (0.8A * 10.4V - 1.1W) = 7.22 W excess
High power: (1.6A * 10.4V - 5W) = 11.6 W excess

At 10.4 V, the RF output can be increased by a factor of 455% while the heat produced is increased by only 160%. The disparity would be even less say in going from 2.5W to 5W.

The efficient way to reduce power output is to reduce supply voltage, not RF power input (what the feedback circuit does). So an external voltage-dropping device is a very good idea.

>The implications of this final observation should be obvious. At 10.4

>13.8 VDC. Since RF output power remains constant, that extra power is
>being dissipated primarily as heat.

That is the only place the extra power could go. The problem is that the feedback circuit is reducing the drive and making the power amplifier less efficient. Running 'open loop', you could possibly get 7W or more RF out, at about the same amount of heat. The limiter is set to 5W as this is generally considered a safe amount to radiate near a person's head for short times.

>you put them in a place where the heat won't cause problems.

Almost any transmitter with a class-C power amplifier is going to exhibit these characteristics, and could benefit from reducing the input voltage. Even if you use only low or medium power, internal heating will still be reduced.

For voltage dropping circuits, I might suggest the old 'active capacitor' consisting of a power transistor hooked up as a voltage follower, with a voltage divider connected to the base. By connecting capacitors from the base to ground to filter the voltage there, a large amount of ripple filtering can be achieved, which may help if you are having trouble with 'alternator whine'. The effective value of the base capacitor is roughly multiplied by the current gain of the transistor. The transistor will need some heat sink (in this example (13.8-10.4)*1.6 = 5.4 Watts). It could be kept cool by attaching it to a metal box. It is easier to remove heat from a transistor than from diodes. This circuit won't regulate the voltage very much, but you don't need to, just reduce it so the radio operates more efficiently. Another method would be a simple series resistor (about 2 ohms in this case) with a big capacitor on the radio side. Since the resistor is sized for high power, it doesn't have much benefit on medium or low other than the RC filtering effect.

If you are using a Astron or similar supply at home for the HT and nothing else that requires the full 13.8V, there is often an adjustment inside that can be used to reduce the voltage to 10 or 11V.

I got a 31 for the same reasons as Walt (I don't know him, he works for another division of Loral).

I also got a IC-2341H for use as a local repeater in the parking lot outside of our building. The building has this mylar on the windows and blocks most of the radio signals (but not the heat during the summer) :-(Having this combo allows me to talk to my wife who works about 25 miles away. We're both using a repeater 1/2 way in between.

I have really come to love the 31. It's been in the seat of my dirt bike (wrapped in a towel and plastic baggie), with the ICOM heaset mike (don't remember the model number). It's also been on the back of my bicycle, with it's rubber duckie antenna. This last one got us out of a jamb, when we were lost on a camping trip. My wife was able to talk us back into camp, using tall ridges/trees.

It's been used by the local sherrif when we were camping and there were some kids lost, (he's studying to become a ham too now).

It had the mods done for out-of-band receive (haven't done the transmit yet). Can receive 50Mhz - 700.95Mhz.

It's pretty easy to use, and seems to fit the bill just fine.

1258. HT too HOT to handle?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-08-30 00:00:00 UTC
From: gkd@wpi.WPI.EDU
Message-ID: <4218j3$geb@bigboote.WPI.EDU>
Source record: 213182

This article summarizes some observations I made concerning the heat generated by my Alinco DJ-580 dual band HT when powering if from an external 13.8 VDC supply. These may be of interest to those who find their HTs getting excessively hot when running them from external supplies. I don't know the extent to which my findings are applicable to other brands and models.

The Alinco DJ-580 has a power jack on the side of the radio designed to accept 13.8 VDC directly. I'd often use an external 13.8 VDC supply when using the HT at a fixed location, but found that the radio quickly gets too hot to handle when doing any serious transmitting. The conventional wisdom is that this occurs because the radio is putting out 5 watts when being powered by 13.8 VDC, as opposed to approx. 2.25 watts when using the standard 7.2 volt battery pack. However, even when transmitting at the medium power setting (which is 1.2 watts regardless of supply voltage), the radio was getting objectionably hot when using the 13.8 VDC supply; but not when running it off the 7.2 VDC battery pack. Analyzing supply voltage, power output, and DC current drain measurements revealed the following (for 2 meters):

- Low power transmit was 0.25 watts, regardless of supply voltage.

- Medium power transmit was 1.2 watts, regardless of supply voltage.

- High power transmit was dependent upon supply voltage. It showed a rather linear rise from 2.25 watts @ 7.2 volts to 5 watts @ 10.4 volts. Increasing the supply voltage beyond about 10.4 volts did not result in any further increase in RF output.

- DC CURRENT DRAIN AT EACH POWER SETTING WAS LARGELY INDEPENDENT OF SUPPLY VOLTAGE. On low power transmit, the current drain was 0.5 A regardless of supply voltage. On medium power transmit, the current drain was 0.8 A regardless of supply voltage. On high power transmit, the current drain increased from 1.1 A @ 7.2 VDC (2.25 W RF output) to 1.6 A @ 10.4 VDC (5 W RF output). BOTH THE RF OUTPUT AND CURRENT DRAIN REMAINED CONSTANT AS THE SUPPLY VOLTAGE WAS INCREASED FROM 10.4 VDC TO 13.8 VDC.

The implications of this final observation should be obvious. At 10.4 VDC, the radio is consuming 16.6 watts of input power to produce 5 watts RF output. At 13.8 VDC, the radio is consuming 22.1 watts input power to produce the same 5 watts RF output. This means that an extra 5.5 watts of power is being used when the supply voltage is increased from 10.4 VDC to 13.8 VDC. Since RF output power remains constant, that extra power is being dissipated primarily as heat.

Consider the medium RF power setting (1.2 W output @ 1.1 A DC current drain, regardless of input voltage). At 7.2 VDC supply voltage, the radio is using 7.9 watts input power. At 13.8 VDC, it is using 15.2 watts input power. That's an extra 7.3 watts of power being dissipated primarily as heat when using the 13.8 VDC supply. No wonder the radio gets hotter!

Measurements with UHF transmit paralleled the VHF findings, although current drains were a tad higher and maximum RF power output was reached at about 11 VDC supply voltage, rather than 10.4 VDC.

These finding suggest that if the DJ-580 were powered by an external source of 10.4 - 11 VDC rather than 13.8 VDC, less heat would be generated without any tradeoff in RF output. My tests confirmed this. The radio still got warm with heavy use when powered by 10.4 VDC, but only became objectionably hot after a slew of long winded transmissions at 5 watts RF output (with a transmit duty cycle well in excess of 50%). Further heat reduction would be expected if the external supply voltage were dropped even more; but there would be a tradeoff in high power RF output.

I'd be interested in finding out whether other HTs have voltage/current/RF-output relationships similar to the DJ-580. If so, hams having trouble with excessively hot HTs when powered from external DC supplies might be able to alleviate the problem by determining the voltage at which high RF power output begins to drop off, and using that voltage level to supply the radio (rather than the full 13.8 volts). I installed 4 or 5 rectifier diodes in series with my (+) DC power lead as a quick and dirty method of reducing the voltage supplied to the radio. Each rectifier diode should have a voltage drop somewhere between 0.6 and 0.9 volts, depending on the device and current drain. If you do this, I'd suggest using diodes with a rating of at least 3 amps. If you need to buy some, go with the 6 amp variety. They will get VERY hot in actual use, and you'll have an extra degree of robustness with these. Just make sure you put them in a place where the heat won't cause problems.

1260. TM-742A

Newsgroup: rec.radio.amateur.equipment
Date: 1995-08-30 00:00:00 UTC
From: rick.edwards@mogur.com
Message-ID: <9508300930442468@mogur.com>
Source record: 213184

I have a new 742A. It is a great radio! I enjoy it very much.
However, I do have a couple of questions that I can't seem to find the
answer to in the manual. Maybe you can help me.

1) When using the autodialer, the button sequence is PTT, PF, & then the
autodialer memory number (#1 in my case). The transmitter turns on when
the PTT is pressed, of course, but then turns off when the PF button is
pressed and then back on for the DTMF string. However, there is no (or
very little) pause between the transmitter turn on and the sending out
of DTMF. I use two repeater autopatches and neither of them likes this
and it _usually_ results in a misdial. Question: Is there anyway to
add a pause or a brief wait between the transmitter turning back on and
the output of DTMF?

2) When using the 742A in a crossband repeat mode between a 220
repeater and my 2m HT, I have to wait for the 220 repeater to drop
before I can transmit. This becomes a real drag when on a roundtable
on the 220 repeater and it has a long hang time. Is there anyway
around this? Is there a way to make the 742A act like a single
frequency repeater on the 2m side (ie. sample the receive every few
hundred milliseconds)?

Thanks....<re>

To use the feature you must be in dual band mode (both VHF and UHF
active). Then it works for me.

BTW has anyone had trouble with the rubber knob coming off its insert?
Mine just rubbed off. I hope its not like the 530 knob.

1262. Sale: TH 28 RF Power Module

Newsgroup: rec.radio.amateur.equipment
Date: 1995-08-30 00:00:00 UTC
From: byron_hellewell@out.trw.com
Message-ID: <1995Aug30.134014.1265@batman>
Source record: 213186

FOR SALE:

NEW, UNUSED RF power module and driver transistor
for Kenwood TH 28A. The module is a Toshiba S-AV22A shown
on the TH 28 schematic as IC 202. The driver transistor
is labeled as R28 and is shown on the schematic as Q206.
They are still in the protective packaging.

I purchased them from Kenwood prior to finding a broken
trace on the circuit board. They cost me $70.

Will sell for $35 shipped.

email to byron_hellewell@out.trw.com

Gosh David, what a personal attack. Hey I don't bash all the RS stuff,
just the junk. Their resistors are great. Never yet had one fail.

On a serious note, since you think I am so negative on everybody, the
ham manufacturers that I think are great and produce quality products:
Ten-Tec, Index Labs, Yaesu, Icom, Astron, and Timewave. O.K. but not
great are Kenwood and MFJ. All my opnions and related to experience.

I won't comment on the RS stuff. They are off the chart in a negative
direction.

From: perryrt@clark.net
Message-ID: <4221iv$gjo@clarknet.clark.net>
Source record: 213188

OK.. I'm (finally) moving out of the Washington DC area and out to Kansas. My wife and I were planning to use our 2m rigs to communicate (simplex, mostly) on the road. I've got a 5w HT that I'm going to rig to a mag-mount 2m antenna and a Yaesu 2400 (and another mag mount) that's in my house right now. I was planning to give the HT to my wife (who will be driving our car). I'm going to be driving the U-Haul truck we rented. Short of running it to the battery, the only way I can think of powering this thing is via the cigarette lighter. My question is: Will it blow up on me? The 2400 puts out 12A at high power, but since my wife will only have 5w at her disposal, I'll probably only be using low (3A) or medium (9A) power.Think this will work, guys?

Thanks in advance!

If you can listen to the 220 directly (just need the moble for the
power/antenna boost), then you could set the 742 for single direction
crossband.

If the repeater has a tone only when someone is on the input, then
get the tone decoder and use it.

From: Bill <Bill@survival.demon.co.uk>
Message-ID: <503029311wnr@survival.demon.co.uk>
Source record: 213197

A UK based charity has developed a pedal powered generator to operate a short-wave transmitter/receiver working at (4.005 MHz). The use is to supply village to village communication in Tanzania Africa. A small pilot project has successfully run for the last 12
years with commercial bought in equipment. The aim is to manufacture pedal generators and short-wave transmitter/receivers locally in Tanzania both to save foreign currency and provide
local employment.

A transmitter/receiver has been designed and 95 per cent completed.

Does anyone know what international regulations such a short-wave transmitter/receivers would have to comply with? The project is based in the UK.

Thank you for any help anyone can give.

Bill

Source record: 213199

Hi folks. The only digital mode I've ever worked before is CW. Now, I want to begin some RTTY and SSTV operation from here in Taiwan with the assistance of one of my local ham friends. I'd be interested in knowing the best rtty and sstv interface to get us up and running in time for the CQWW RTTY DX contest later this year. We already have the following:

Rig,Amp,Antenna,486 PC, 8 bit sound card. Heard we could qrv on sstv using the sound card...is it true? Otherwise, looking at the PASOKON SSTV card (73 Mag last month) and have no idea what rtty controller to buy. Thinking about a MFJ-1270. Any suggestions?

P.S. Not interested in Packet or the other dig modes, Just good old RTTY and some SSTV.

The Radio Shack HTX-202 is a good rig for the money....however I wouldn't
pay $260 for it because they put it on sale ever so often for $189. That
is the price I paid for mine. I've had it for about 6 months and it has
worked flawlessly. Check with your local store and they may tell you
when it will go on sale again ... if not, be patient -- it won't be long.

Congrats on your new license...73's ED AA9OE

I had a similar experience. Bought 2 batteries (for a camcorder). One
worked for 6 months, other NEVER held its charge. They refused to honor
their warranty. Lousy batteries with even worse customer service.
I even wrote a letter to Adv mgr at ARRL re "standing behind their
advertisers' integrity" Just got a form letter back and that was that.

Call their FAX Infoline at (714) 974-3485. By following the voice prompts, you can request docs directly from Comm Spec.

You must be able to send touch-tones thru your fax...it sends them during your call, rather than calling you back.

I have gotten several good docs and radio hookups from the info line.

Congrats on the move to the Midwest. I would like to do the same, only from California...

The last U-Haul I rented had binding posts on the dash with 12VDC available. I suppose we could tell each other that they did it for the Ham community, but my real guess is that they got tired of people butchering the wiring to hook up CB's. I know from several years of experience in repairing over-the-road trucks that some people will cut into any wire with power on it to hook up accessories.

Drive safe.

Hello from Aussie,
Who makes a basic type kit for a simple transceiver that covers the whole 80m band on SSB and preferably CW as well? QRP type is ok. Must be reasonably cheap price. Perhaps making use of available ICs to minimise component count. Here in Australia I cannont find such an animal, most basic kits only cover a small section of the 80m band. An American HAM here sugested that a company called Ramsey may have something available. Does anyone have any ideas or contacts that I could check out?
Thanks, Ron VK1NRC.

Allan,

Call ICOM America at 206-454-7619, press " 3 " when the automated system answers. You will then be connected with ICOM's parts dept. They have a manual titles the " CI-V Reference manual " for sale at a cost of about $15.00 plus shipping. This manual has the commands for the IC-R7100. Newer ICOM radios now have the command set for the radio right in the operators manual so it is doubtful the CI-V Reference Manual will ever be updated

Hi Darrell,

I have a 742A and the only problem I had with it was that with the 6Meter module installed, you had to turn the rig on, then off and then on again because even though you had a display, you couldn't receive or transmit.

It turned out to be that the module wasn't "talking" to the microprocessor for some reason. Changing out the VCO in the '42A did no good. Finally they replaced the module with another one and it worked.

Other than that, I like it very much.

A couple of companies were kind enough to provide the hams
with some excellent equipment to use during the 1995
Special Olympics World Games in New Haven, Connecticut, July 1-9.
They said that when the event was over we could send the equipment
back ... or ... sell it to any interested hams at generous discount
prices. So here's your chance:

Time is just about up, and all this equipment will be returned to
the manufacturers if not sold ASAP...

Rules of the game:

1) Prices are firm (set by manufacturers, not me), so no haggling,
trades, etc.
2) All items are COD, you pick it up from me, by appointment only.
Or send a check/MO and include shipping costs. Call me AT HOME ONLY
at 203-827-9956 to get directions, set appointment to meet, etc.
3) First purchaser to offer to bring CASH, money order or non-rubber
check takes the item.
4) Equipment is sold as-is, and it all works fine. Everything comes
in its original box with manuals, etc. I've been told all gear has
original factory warranties. Service is between you and the manufacturer.
5) Equipment can be picked up at my home or office, by arrangement
only--no "drop ins"--or shipped UPS if you prepay. Call me at home only,
at 203-827-9956, from 8 AM to Midnight ONLY, and leave a message on my
answering machine that includes the following: Your name, call sign,
telephone number, the date and time you called, and the equipment you
want to purchase. I will call you back only if the equipment is still
available, to make arrangements to have you pick it up and drop off
the payment.
6) I'm not going to call back dozens of people to tell them something
is already sold--if you don't hear back from me in 2 to 3 days, assume
you missed out. And for confidentiality, privacy, and to keep from
getting sucked into third-party haggling, I'm not going to tell you
who anything is sold to, so please don't ask.

: Unless you're the ARRL or K1MAN...

Quite true!

I did enjoy Gary's reply. A level of dry deadpan humour allied to an excellent wind-up.

Occasionally Britain does something right (I rather enjoy criticising the other occasions). Here, there is no broadcasting allowed in amateur licences. A special licence that does allow broadcasting, GB2RS, has been issued to the RSGB. I'm not aware of anyone else with one.

In the US, you have no defence against an increasing number of people starting to broadcast, and it wouldn't take very many to bung up all useful bands, each playing 24 hour tapes into multiband banks of transmitters...

I think the key would be a special licence, and a special prefix, and an amazing set of bureaucratic hurdles to getting one ;-)

Cheers
David

Dave,

If you like 10 Meters you'll like 6 Meters. Propagation includes E, F2,
Extended Ground wave, Back Scatter, Aurora, Meteor Scatter, and yes EME.

I've worked out to Central Pacific, C.A., N.A., S.A., Africa, Europe, etc.

So far I've worked ~350 grids and just got #200 confirmed, WAS, and 54
countries
worked. Many others have higher totals. Of course you have to watch the
conditions more than HF but it is fun. Currently the band is in a lull.

10W will work but >= 100W is better if you don't have problems with TVI.

I use 6 as an indicator for possible 2 Meter Aurora, E's which has really
helped
out as does 2 Meter Tropo openings help in getting 432Mhz contacts.

: I would appreciate your comments on the Radio Shack 2m Handheld
: transceiver.
: I'm a rank beginner with my new tech licence, looking for my
: first rig.

Had mine since April, and it has worked without failure. Well, that's not even six months, so it should work fine. It is true FM, unlike many on the market today.

The only negatives I can contribute: a) It has only 12 memories. This may not be that important if you live in an uncrowded area, but in the repeater-intense LA area, it would be nice to have more, say, twice as many. b) Unlike many others, there is no extended receive capability (ability to receive the aircraft and VHF public service band), which has good and bad points. On the positive side, this helps to keep the intermod down in an area as described in a). c) Unless you don't mind wearing it in a belt pouch, it is heavier than most competitive units.

: Is it a good buy for $260? I notice that they bundle in a few
: options in the
: price, that others don't. Is there a better choice in that
: price range?

That depends on your budget. As another said, wait for the next sale. I bought mine for $189.95 in April, then bought the 440 version, the HTX-404, two weeks later; it was also on sale for $70 less at $229.95. I wouldn't bother with the extended warranty unless your budget is tight. At under $200, if it lasts for a couple of years, I consider it a throwaway item.

Congratulations on your new license. My wife just got her Tech two weeks ago, and is looking for a 2m handheld unit, with small size and light weight as her criteria, all other things being equal.

73, and welcome to a great hobby,

Jim

1293. The Hamblaster Moon Filter

Newsgroup: rec.radio.amateur.equipment
Date: 1995-08-31 00:00:00 UTC
From: willco788@aol.com
Message-ID: <423ivl$bsp@newsbf02.news.aol.com>
Source record: 213081

The moon filter is DOS software package that includes a binary file.
A binary file is actually software that is uploaded to the Hamblaster.
Once it's loaded into the DSP RAM, The DSP runs a filter program
and communicates to the PC via the Hamblaster handshake port.

Here's some technical data

moon.doc 21:04:23 5/30/1995

The moon filter is a very narrow band linear phase filter capable of
producing a 1 Hz bandwidth with a transition region of 1/2 Hz providing 60
dB attenuation. The bandwidth is adjustable in powers of 2 providing a
maximum filter bandwidth of 256 Hz with 128 Hz transition region.

The filter center frequency is tunable in fractional Hz increments.

The filter can be phase locked to the input signal to provide variable
bandwidth tracking of the input signal as the frequency drifts due to
the variation in propagation delay due to atmospherics or due to
receiver or transmitter instability.

A "cartwheel" tuning display provides important filter tuning information
at a glance and also is useful for displaying signal strength. Three
oscilloscope
displays are also available.

The Signal to Guard is a dual trace display that shows the signal strength
verses
guard band. It's useful for analyzing band conditions and sweeps in
real time
using a 486-66 DX2 with the turbo button turned off.

The Signal Vs AGC is a dual trace display for checking the AGC level. It
will be
used to adjust the ACG (an AGC control will be available in a future
version)

The Signal vs Tuning is a dual trace display for accurately tuning the
filters center
frequency. The tune trace indicates dc voltage level of the
discriminator algorithm
and when the voltage is too high or low, the filter is mis-tuned

There's also a code regenerator that works very well even when a 32 Hz
filter is selected.
The regenerator is an oscillator that's keyed with a signal detector.
When it's enabled,

the background noise and filter ringing is completely removed. It's the first regenerating
filter that works well with weak signals.

Other controls include; volume, input gain, filter tune, filter bandwidth and display

>that will take a 6M model) or do most just work FM?

I think most of the activity is on SSB. FM doesn't work as well as SSB
when you have a band opening that results in 10 or 20 stations all on
the same frequency trying to work a DX station.

>Do most just work simplex, or work repeaters?
>Do operaters on 6M have problems causing interference on the TV

It is a problem in areas with a weak but desireable channel 2 station.
It isn't if you have Channel 3 or a local (really strong) channel 2
station.

It can be an exciting DX band for working thousands of miles via
Sporadic E and other propagation modes. On the other hand, the
band can be absolutely dead except for the locals. You need either
patience or luck to do well on 6 meters with low power. Of course,
big stations running SSB, a big amp, and a big antenna on a good
hilltop often have a range of 300 or more miles--all the time.

>frequencies?(I've heard that used to be a problem)
>Why do many 6M Rigs only operate on 10 watts?

Most of the Japanese are licensed to run a maximum of 10 watts.
Japanese manufacturers often design their stuff for the home market,
so a low power 10 watt version is usually available--though USA
importers usually stay away from them (unless you want to order
20 of them).

No. I do this all the time; it will work fine for your purpose. The only potential problem is some alternator whine, which shouldn't be a big deal, as this is only a temporary arrangement. Good luck in The Heartland.

Source record: 213087

I was curious, so I called both Yaesu tech support and RT Systems (the makers of the programming software).

Yaesu said it wasn't a "recommended mod", but that the software freq change using the programmer shouldn't hurt the radio.

When I called RT Systems, the gentleman I spoke with said the radio was only capable of receiving from 100-180 and 375-525 MHZ. Anything out of those freqs would not be heard at all...

Reply direct if you have any luck with this, I am still testing it out myself.

I want to connect a digital frequency counter to my SP-600. I there anybody out there with schematics of it? I have made the counter but when connecting it loosely around the oscillator valve, the reception is distorted by interferense from my counter's internal XTAL. Any help wanted!

1303. ADI model 48 440 MHz HT?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-08-31 00:00:00 UTC
From: c594911@cclabs.missouri.edu
Message-ID: <425be4$mfl@news.missouri.edu>
Source record: 213091

I saw a pair of 70cm HT's for sale in a local surplus store the other day. They're made by a company called ADI with model numbers either 42 or 48 (can't remember). I fiddled with one and they seem like nice simple radios with all the features (pl, dtmf, etc). They also look rather recently manufactured. Does anyone know anything about ADI and their equipment?? These are definitely ham rigs in the range 440 - 450.

thanks for any info...

Tom Lindberg, N0YYW

I have its predecessor -- the TM-741A. The RF modules are identical with those in the 742A.

It is a fine rig, generally. Subject to intermod like all of them (if we could get rid of this need for receive-everywhere and convince the vendors that we didn't want it, we MIGHT be able to get a decent AMATEUR RADIO transceiver out of them). The remotable control head stuff is really flimsy -- at least on the 741. But its nice to have that little control head up on the dash, with the rest of the junk tucked away in the trunk.

I don't know if Kenwood wasted memory space on the "games" in the 742. I guess Japanese engineers think we like playing games on the radios when nobody's on the repeater. Gracious. :-) There ought'a be a law against such garbage ...

1309. Alinco DX-70 MODS and IC-706 PRICE - I have both

Newsgroup: rec.radio.amateur.equipment
Date: 1995-08-31 00:00:00 UTC
From: fitr%mimi@magic.itg.ti.com
Message-ID: <423me2$stv@tilde.csc.ti.com>
Source record: 213097

Thanks to a fellow ham, I now have the following mods
available for the Alinco DX-70 HF rig. I'll type them
into an ascii format and post here. I did the mods last
night and all seem to work well. Mods came from Alinco,
and the following is what I have:

Extended RX on HF (down to 30 Khz, Up to 35 Mhz)
Extended TX on HF (opens TX to above AKA: beyond MARS)
Extended RX on 6 (down to 45 Mhz, up to 60 Mhz)
Extended TX on 6 (opens TX to above AKA beyond SIX)

The mods only require removing the front control panel,
unscrewing 4 screws, popping off a back panel,
desoldering four super tiny chip resistors, making 2
solder bridges, and a cpu cold reset. Neato stuff and
really W-I-D-E coverage.

Also, talked to several JA's during the past two weeks
about the price of the Icom 706. Price in JA was 128000
yen lsit, but with the customary 20 to 21 percent
discount, actual price is 101000 yen. At todays exchange
rate (about 99Yen/$1) this might be the best value going.
Of course, the JA versions are typically "stripped down"
(ie no ctcss, lower output PA, etc) but this should give
an idea of the price being under $1100 USD.

Just what I know. Email me if you want the Alicno mods
with a Fax number....I'll send 'em.

From: jeff.sumberg@sailboard.com
Message-ID: <8B03419.012D001A6D.uuout@sailboard.com>
Source record: 213102

My thanks to all those that responded to my original thread pertaining to the Heathkit HO-10 monitor scope and the segmented trace display. To those that suggested that it was 60hz intensity modulation, and to try adding a .1 cap between the cathode and the control grid, you were correct. I added a .1 to the existing .001 that was there and the broken trace disappeared at all intensities except for very very dim (which is not where you'd use it anyway). But...

Also noted while the unit was opened were the filter caps used in the high voltage supply. It had been suggested that these could be the problem. The schematic shows .15 caps being used. Somebody over the years replaced these high voltage filters with .01 caps. Since I didn't have at my disposal a .15 1500v cap, I kludged up about a .07 by using 3 .22 at 600v caps. When these were added to the existing .01 filters (making about .083), almost all of the original problem went away. So by boosting up the filter caps and adding the .1 to the cathode/control grid, the problem is solved.

Thanks again to everyone that made suggestions.

I am interested in purchasing old mechanical calculators and slide rules.

I collect the old electro-mechanical "rotary" calculators that were made by Frieden, Marchant, Monroe, and other manufacturers from the period of the 1920's through the late 1960's. I also collect non-electrical mechanical calculators and am particularly interested in Curta brand calculators. I am not interested in adding machines that print on tape or electronic calculators.

If you have an old mechanical calculator or slide rule collecting dust in a closet, please send me an e-mail message.

JAN offers very cheap crystals, but they frequently don't work! I bought
about a dozen JAN crystals for some 6-meter channel elements. When they
came in, I spent DAYS tyring to figure out why the 6-meter rig wouldn't
come up. The cause was 6 to 8 dead crystals! I tossed the whole lot as I
had no faith that the working ones would continue to do so.

: Why do many 6M Rigs only operate on 10 watts?
: I probably can't afford to get into 6M right away, but research dosen't
: cost too much!

I'll try to answer a few of your questions.

Definitely the all-mode 6m transceiver is the way to go. The 6m band has some really surprising results when it is in good shape, as it has been for much of this summer. Some really long-haul contacts have been made on 6m SSB and CW.

Not sure how much simplex FM activity there is. As far as repeaters, there aren't many on here in the LA area, and this must be the repeater capital of the US. There are far more on 1.2 GHz than on 6m.

Yes, 6m work can tear up channel 2 on the TV; maybe that's the reason that 6m repeaters aren't that popular here.

Can't comment on the 10w power issue. The new Icom IC-706 covers HF and 6m with 100w output, then drops to 10w on 2m. I've heard a lot good about the IC-575, which is a 10m/6m all-mode transceiver. I believe that it has been discontinued, and is fairly expensive, but it cranks out reasonable output power.

Not to send you off the track of a HTX-202, but I've just heard about the 4th radio in my county going on the blink. Intermittent transmit. All the same problem. The latest one is 3 months old. Whenever used on 12 V. it is on a mobile 5/8 antenna.

True, I don't know how many operators in my county have the HTX-202, exactly. There are approximately 1300 or so amateurs that live in my county. I'm sure they don't all own the HTX-202. ;-)

The ones that do work sound good. The owners like them. Just about every owner that I have talked to has the extended warranty. (And it is apparently pretty good tha they do have it...)

> Is it a good buy for $260? I notice that they bundle in a few
> options in the
> price, that others don't. Is there a better choice in that
> price range?

Considering the problems that I've heard with this HT, >if it were me<, I wouldn't purchase it without the extended warranty. Figure another $40 or whatever it costs onto the price of your HT. Now you're looking at around $300. Is it worth that much? In my opinion, no.

Now if you get it for the sale price of around $190 + $40 warranty, you're looking at $230ish. Yeah, maybe it is worth that to someone. Did I say "Don't buy this radio without the warranty?" Well, if I didn't say it, be sure you don't buy it without the warranty.

Actually, I think Radio Shack ought to adjust the price of their radio so it includes the price of the 5 year warranty. Of course, others may not think that way... I'm just going by the track record I've seen from locals on this radio...

I must add that Radio Shack has been very good to the locals in the customer service department. They stand behind their product. That is an important consideration when considering a purchase of most anything.

It is reported that the HTX-202 is very good in a high RF environment. It tends to not suffer from intermod interference. This might be something to consider, too.

All in all, I'm pretty neutral on the HTX-202. I probably wouldn't buy
one for myself, but I'm not in the market for a 2M HT, either.

Contratulations on your new license and enjoy--

73,
Ken

Morgan,

Maybe you could use the regular (i.e. non- NiCad) battery pack which is
supplied with the HTX-202 and remove the AA batteries?

Attention all Net'ers!

I want to announce to you a new service provided by The Catalina BBS.

We now provide LISTServ service to all users great and small. A LISTServ
allows you to keep track of family and friends easily and efficiently,
run technical support and announce product updates and hints to your users,
and provide information on your products and services to anyone interested.

To find out more about this inexpensive service that anyone on the InterNet
can use, send a blank e-mail message to: listserv-info@catalina.org

Setting up a ListServ is as easy as TelNetting to our BBS and entering in
your information! You can find out full information about the service, and
if you like, order your ListServ. It will be set up immediately upon your
choice of payment OnLine, and you'll receive a startup message within 10
minutes! Just TelNet to catalina.org and log in as "InterNet".

Thank you!

Ryan Brown
SysOp, The Catalina BBS
postmaster@catalina.org

NOTE TO MODERATOR: I hope that this post has not been off topic. I
carefully selected what conferences it was placed into. Please let me
know if I have made any error -- my apologies in advance.

1331. I need some advice !

Newsgroup: rec.radio.amateur.equipment
Date: 1995-08-31 00:00:00 UTC
From: buddy10@aol.com
Message-ID: <425pq7$son@newsbf02.news.aol.com>
Source record: 213119

Well, I passed my General class upgrade tests on sunday !!! I can FINALLY
get on the prime
Worldwide bands ! I am now finalizing the plans for my layout. Here is a
rough idea of what my
lot looks like :

----------80'----------

- -
- [15' Tree]
- -
-
- -
-
- -
- OPEN
- House -
- < YARD > -
-
- N
38' -
45' W + E
- Height = 12' -
- S
- -
-
- -
- ________25'_____________ -
-
- -
- -
- - [20' Tree]
- -
- -
-__________45'_____________
- -
-
- Garage 20'
-
- -
-
- Height = 12' - <
Driveway > -

- -
-

-

It is,basically, an 80' x 45' lot. Power lines run along the
fence(North to South) at the back of
the property, they are up at about 25'.
Here is what I propose to do for Antennas :

Running North to South I will have a Multi-band Windom antenna(about 65'
long) up about 30'.
About 10' of the ends of the Windom will be drooping down(They will still
be about 20' above the
ground). The Windom will Start at the SouthWest corner of the Garage & go
to the North West
corner of my lot. This Antenna will give me general West to East
coverage.

Running West to East I will have a 20Meter Band Half-Square,up about 30'.
The bottom of each
"leg" will be about 10' above the top of the garage. The Half-Square will
start at the SouthEast
corner of the garage & go to the Middle of the house. I chose the
Half-Square for It's DX abilities.
I want to contact Antarctica by HF(Bad propagation,I know. But I can try
!). Not being able to use
a Big Beam on a tower , I figure this is my best shot(better than a low
dipole at least). I will also
use this for general coverage on 10meters - 40meters, using an Automatic
Antenna tuner(not
optimal,I know,but it should work for now).

I've had good luck with a Kenwood TH-77. My suggestions:
- Used equipment in good shape is a better deal than buying new. Buy
locally if you can. Bring a friend along. Also scan the net to
get an idea on prices.
- Make sure it can receive on both bands at once. The TH-77 can send
audio from one band to a speaker-mike, with the other to the built-in
speaker. Some so-called dual-banders can only recieve on one band
at a time.
- Just remember it's an HT, not a mobile. They generally have intermod
problems when attached to a decent antenna.

I"m about six months ahead of you getting my technician and addressed
the same issue. After talking with older and greyer HAMS, I opted for
an ICOM W-31A. My rationale:

1) A lot of my traveling is at night so I wanted a lighted keypad. This
almost forced me to the ICOM line.

2) Memories: I travel a lot to a home in New Hampshire and a workplace
in Virginia. I've my ICOM programmed for both places, as well as home
base in Owego NY. I needed a lot of memory in order to do this. The
IC W-31A has fifty memories for each band.

3) I didn't want a detachable mike/keypad as it made the keypad smaller
and I"m "fat fingered".

4) Accessories: I also purchased the cigarette lighter adapter to give
me unlimited power supply (and 5 Watt transmit as well) and a "hot rod"
antenna to help ensure that I "get through" in emergencies.

Hi Tom, I too have tried several computer logging programs. I assume you are
interested in the casual day-to-day logging, not contest logging. For casual
daily QSO's, I've found HYPERLOG (TM) to be a superb logging program. I
believe
version 2.24 was a "testware" program that allowed free testing for a period of
time. If you like it, it can be purchased for 49.95 or something there abouts.

Features I enjoy: shows prior QSO's with a station that you've worked before,
date, time, band, etc. Shows QSO's with that country before. Automatically
tally's DXCC and WAS by band, by mode. Has default settings for power-up (I
enjoy 17 mtr CW, so it automatically comes up in that mode. Setup option

allows me to store long/lat data of my qth and shows the lp and sp and distance to the country being worked. Print function is decent. Does QSL labels.

Though it's not totally free, it is worth 50-bucks (their advertisement says "less than a hundred foot roll of RG-8 coax). Anyway, some 4000 QSO's later, I still am using the HYPERLOG software. No, I have no affiliation with Hyperlog in any way. A friend in JA introduced me to the software after trying something called DXB (did not like it). Just a pleased customer.

I don't understand why you suspect trouble in the vertical deflection system, since you described amplitude modulation, not vertical deflection, of the spot.

I would first guess that you have hum on the CRT's control grid, or earlier in the amplification chain.

And the first place I'd look for that hum is in the power supply: the electrolytic filter capacitor may have become defective in its old age.

> not result in any further increase in RF output.

This is because the radio has a feedback circuit which measures the power output (actually it often measures the RF voltage output), and adjusts the RF drive to the power amplifier module to achieve the set amount. On the high power setting, the feedback loop cannot achieve this unless, obviously there is enough DC voltage to allow the amplifier to reach 5W output. The exact point where the feedback circuit starts to reduce the power depends on many factors, in this case it was 10.4 V. Probably most HT's are designed to fall close to this number, as the '5 W' NiCd pack supplies only 12.0V, not 13.8 or more that can come from a vehicle's electrical system.

> BOTH THE RF OUTPUT AND CURRENT DRAIN REMAINED CONSTANT AS THE
> SUPPLY VOLTAGE WAS INCREASED FROM 10.4 VDC TO 13.8 VDC.
>
My tests with the power amplifier from a Motorola Mocom radio tended to show that the amount of heat produced is controled primarily by the supply voltage and not the power output. In other words, reducing the RF output by reducing the RF input to the amplifier caused the DC input current to drop, but the "excess" DC input power (DC power - RF power) remained almost constant.

This is somewhat confirmed by your numbers above:
Medium power: (0.8A * 10.4V - 1.1W) = 7.22 W excess
High power: (1.6A * 10.4V - 5W) = 11.6 W excess

At 10.4 V, the RF output can be increased by a factor of 455% while the heat produced is increased by only 160%. The disparity would be even less say in going from 2.5W to 5W.

The efficient way to reduce power output is to reduce supply voltage, not RF power input (what the feedback circuit does). So an external voltage-dropping device is a very good idea.

>The implications of this final observation should be obvious. At 10.4
>VDC, the radio is consuming 16.6 watts of input power to produce 5 watts
>RF output. At 13.8 VDC, the radio is consuming 22.1 watts input power to
>produce the same 5 watts RF output. This means that an extra 5.5 watts of
>power is being used when the supply voltage is increased from 10.4 VDC to
>13.8 VDC. Since RF output power remains constant, that extra power is
>being dissipated primarily as heat.

That is the only place the extra power could go. The problem is that the feedback circuit is reducing the drive and making the power amplifier less efficient. Running 'open loop', you could possibly get 7W or more RF out, at about the same amount of heat. The limiter is set to 5W as this is generally considered a safe amount to radiate near a person's head for short times.

>you put them in a place where the heat won't cause problems.

Almost any transmitter with a class-C power amplifier is going to exhibit these characteristics, and could benefit from reducing the input voltage. Even if you use only low or medium power, internal heating will still be reduced.

For voltage dropping circuits, I might suggest the old 'active capacitor' consisting of a power transistor hooked up as a voltage follower, with a voltage divider connected to the base. By connecting capacitors from the base to ground to filter the voltage there, a large amount of ripple filtering can be achieved, which may help if you are having trouble with 'alternator whine'. The effective value of the base capacitor is roughly multiplied by the current gain of the transistor. The transistor will need some heat sink (in this example (13.8-10.4)*1.6 = 5.4 Watts). It could be kept cool by attaching it to a metal box. It is easier to remove heat from a transistor than from diodes. This circuit won't regulate the voltage very much, but you don't need to, just reduce it so the radio operates more efficiently. Another method would be a simple series resistor (about 2 ohms in this case) with a big capacitor on the radio side. Since the resistor is sized for high power, it doesn't have much benefit on medium or low other than the RC filtering effect.

If you are using a Astron or similar supply at home for the HT and nothing else that requires the full 13.8V, there is often an adjustment inside that can be used to reduce the voltage to 10 or 11V.

Subject: Info Syntor X radios

I need some information on several Syntor X radios. These radios are programmed for the 154.00 public service band.
1) Is it possible to reprogram these radios for 2-meter?
2) What type of equipment is required to program them?

All of the ID numbers are identical except for the serial #'s.
tx: CC3372 ID: T73VBJ7D04BK
rx: RC0291 MOD: T99VB+008W

Any information you can provide about these radios will be greatly appreciated.

Congrats on the move to the Midwest. I would like to do the same, only from California...

The last U-Haul I rented had binding posts on the dash with 12VDC available. I suppose we could tell each other that they did it for the Ham community, but my real guess is that they got tired of people butchering the wiring to hook up CB's. I know from several years of

experience in repairing over-the-road trucks that some people will cut into any wire with power on it to hook up accessories.

Drive safe.

Subject: Need Ten Tec SCOUT555 info

Does anybody have or know about SCOUT-555 inexpensive mono band transceiver from Ten Tec? Please let me ask you a couple of questions.

1.What sort of circuit is in a band module? The band module is the one you have to pull out and push another one into the transceiver to change the band.

2.Would it be possible to build the band module by yourself?

Thanks in advance,

Subject: opinions on Standard C508A?

Hi,

I have had a C508A for about a month. Great HT, but careful of the limited output power - even with an external antenna on a car I have difficulty getting reliable QSOs thru repeaters. I am looking at buying a "brick" amplifier to get round this. The other restriction is the audio

output is not enough for use in a moving car unless you use a headset.

Its best applications are the ones I bought it for - hill topping on climbing trips and use in hotel rooms when travelling. Sure there is no autopatch capability, but look at the size and price! The scanning capability is awesome.

Last weekend I was able to access repeaters in San Francisco on 440MHz from a 12,000 ft mountain in Yosemite National Park - about 150 miles - all on the 3 inch long antenna! Also used it in the UK a couple of weeks ago - the C-508A built-in 1750 tone capability is needed to access British repeaters.

Let me know if you need more info.

From: rick.edwards@mogur.com (Rick Edwards)
Subject: TM-742A

I have a new 742A. It is a great radio! I enjoy it very much. However, I do have a couple of questions that I can't seem to find the answer to in the manual. Maybe you can help me.

1) When using the autodialer, the button sequence is PTT, PF, & then the autodialer memory number (#1 in my case). The transmitter turns on when the PTT is pressed, of course, but then turns off when the PF button is pressed and then back on for the DTMF string. However, there is no (or very little) pause between the transmitter turn on and the sending out of DTMF. I use two repeater autopatches and neither of them likes this and it _usually_ results in a misdial. Question: Is there anyway to add a pause or a brief wait between the transmitter turning back on and the output of DTMF?

2) When using the 742A in a crossband repeat mode between a 220 repeater and my 2m HT, I have to wait for the 220 repeater to drop before I can transmit. This becomes a real drag when on a roundtable on the 220 repeater and it has a long hang time. Is there anyway around this? Is there a way to make the 742A act like a single frequency repeater on the 2m side (ie. sample the receive every few hundred milliseconds)?

Thanks....<re>

Hi Darrell,

I have a 742A and the only problem I had with it was that with the 6Meter
module installed, you had to turn the rig on, then off and then on again
because even though you had a display, you couldn't receive or transmit.

It turned out to be that the module wasn't "talking" to the
microprocessor for some reason. Changing out the VCO in the '42A did no
good. Finally they replaced the module with another one and it worked.

Other than that, I like it very much.

Source record: 213005

I can't get my R7 to tune up on the 20, 15, 12, or 10 meter bands.
It seems to work fine on 40, but not for the others. I have had it
down several times, inspected connections, measured lengths according
to the instructions, verified that all connections were clean and bright,
and even used aluminox during the assembly to keep everything from
oxidizing.

Any clues or help out there?
Thanks,
Ed Burress

Icom IC-901A 2m/440 dual band radio

This is the Icom model the features a remote face so it is easy to mount in a car. You attach a single cable to the radio. On the radio, you have connections for:

2 speakers (main and sub channels)
Mic
440 antenna (N-connector)
2m antenna (PL-259 connector)
12V power

I am included a hand-held DTMF mic with up/down control.

This radio does it all. 2 VFO's for 2m/440 simitanious display. (you can use 2 speakers, one for 2m and one for 440, or hook up a signle speaker for both) 20 memory channels, lighted buttons/display, every setting can be configured, etc.

This radio is in beatiful condition, and never used in a car (I used it in my shack with a 12V PS)

Debts are piling up and I have to sell off my shack. Please make me any offer.

Please make me any offers or questions via email. I do not get a chance to read this newsgroup too often. Thanks!

>$200.00 or so ? I REALLY appreciate any help on this !

>P.S Just joking about the tone at the beginning !

Well while your complaining about the down turn in the sunspot cycle I
will be working Eruope and VE1 maritime mobile's While your out trying
to dig a pit large enough to berth the Queen Mary for a new footing
for your tower. I will be playing DX hunter with a 7element beam I
built for less than $50. On a push up pole I got because nobody could
think of what to do with it. Using a rotor I bought brand new for
fifty bucks. The Antenna has 12 DBD gain. at forty feet. yes I
capitalized the DBD part that is gain over a dipole. It makes the
difference of 3S units on most signals. As I live in Daytona Beach FL
I have no mountains to try from or bounce off of. But I can set here
and monitor a few of the more common repeater Freq. and when they
start showing up I know that the E layer skip is in. I have found that
a thunder storm will signal good conditions. Or just a plain old
weather front;. I have a great Idea since you dont want to get 6 mtrs
it will be that much easier to work the Europeans during the 4 or 5
months of the year I might can work them. Suppose? No i guess my
biggest problem is when I can't get those guys in the islands and
South America to quit calling me while I am trying to work some lady
driving around in her car in Penn. Or New York. Naw forget getting 6
mtrs it is no fun at all.

>equipment?? These are definitely ham rigs in the range 440 - 450.
>thanks for any info...
>Tom Lindberg, N0YYW
><c594911@showme.missouri.edu>

Hi Tom, The ADI transceivers are a product of Taiwan. Living here, I see loads of them on the market. I've also seen them over in Hong Kong at the ham shops there. The quality is marginal, so be careful unless the price is a steal. The ADI transceivers are based on the STANDARD (Japan) equipment designs. They are very similar (in fact, some look identical) but definitely NOT the same inside. The ADI use cheaper components, impossible to get factory serviced, etc.

I see now that Mouser Electronics, in the USA is marketing the ADI transceivers. The ones sold by Mouser are the newest models and look to be highly improved over the original ADI 28 (VHF) and 48 (UHF) but be cautious. Any "orphan" radio can be a disaster if ever needing service.

1347. Found Radio in Road

Newsgroup: rec.radio.amateur.equipment
Date: 1995-09-01 00:00:00 UTC
From: swdecato@nps.navy.mil
Message-ID: <425jo9$18r@nps.navy.mil>
Source record: 213122

My wife was driving down the road the other day and spotted a little black box in the middle of the road. She stopped to investigate and it turned out to be GE Radio (transciever).

On the back it says ERICSSON GE Model PAJ02. The battery pack was missing and it was pretty scratched and dented by being run over by cars. On the bottom there are several power connections where the battery was. I experimented until I got the digital display to light up when connected to a little 9v battery. I was also able to get audio out of it so it appears to be working. I suspect it is a public service type radio.

My question is... Does anyone know what type of radio this is? How are the operating frequencies changed? What are the input voltages for proper battery connection. I'm just wondering if I could get the thing to work on 2 meters.

Butch, It shouldn't be that hard to put in an aftermarket tone board.
The factory board will only let you set it up for three different
frequencies, if I remember correctly. If you only need one frequency,
I would look at one of the miniature tone boards that Communications
Specialists sell. They are available from a lot of the mail order
places. They are very simple to hook up. The original factory tone
board plugged into a small plug on the 7950. My guess it was a B+,
GND and tone into the radio line. Even if it is not, you can call
Communications Spealists and they will tell you where to connect their
boards on most radios. I hope this helps....73's Floyd WD5ENJ

1354. Crystal Radio Information?

Greetings all!
Does anyone have any references (anything at all!) to Crystal
Radio construction? i know how they work, and built one way back when,
but could use some schematics or instructions so we can build a couple
in class! The easier the procedure, the better!

thanx! and 73...

Does anybody have or know about SCOUT-555 inexpensive mono band transceiver from Ten Tec? Please let me ask you a couple of questions.

1.What sort of circuit is in a band module? The band module is the one you have to pull out and push another one into the transceiver to change the band.

2.Would it be possible to build the band module by yourself?

Thanks in advance,
Atsushi Otsuka, 7K2COJ/KE6FFS

Hi!

I'm looking for electronically tuneable Gunn transceivers for a university research project. I need them to facilitate wireless data transmission at 10 megabits/second, so I would prefer a pair - but single is also OK.

I am particularly interested in the Microwave Associates' MA87127 and MA87125 models. I don't care if they're old and battered, as long as they work!

Thanks

: > transceiver.
: > I'm a rank beginner with my new tech licence, looking for my
: > first rig.
:
: Not to send you off the track of a HTX-202, but I've just heard about
: the 4th radio in my county going on the blink. Intermittent transmit.
: All the same problem. The latest one is 3 months old. Whenever used
: on 12 V. it is on a mobile 5/8 antenna.
:
: True, I don't know how many operators in my county have the HTX-202,
: exactly. There are approximately 1300 or so amateurs that live in my
: county. I'm sure they don't all own the HTX-202. ;-)
:
: The ones that do work sound good. The owners like them. Just about
: every owner that I have talked to has the extended warranty. (And it
: is apparently pretty good tha they do have it...)
:
: > Is it a good buy for $260? I notice that they bundle in a few
: > options in the
: > price, that others don't. Is there a better choice in that
: > price range?
:
: Considering the problems that I've heard with this HT, >if it were me<,
: I wouldn't purchase it without the extended warranty. Figure another
: $40 or whatever it costs onto the price of your HT. Now you're looking
: at around $300. Is it worth that much? In my opinion, no.
:
: Now if you get it for the sale price of around $190 + $40 warranty, you're
: looking at $230ish. Yeah, maybe it is worth that to someone. Did I
: say "Don't buy this radio without the warranty?" Well, if I didn't say it,
: be sure you don't buy it without the warranty.
:
: Actually, I think Radio Shack ought to adjust the price of their radio
: so it includes the price of the 5 year warranty. Of course, others may
: not think that way... I'm just going by the track record I've seen from
: locals on this radio...
:
: I must add that Radio Shack has been very good to the locals in the
: customer service department. They stand behind their product. That is
: an important consideration when considering a purchase of most anything.
:

: It is reported that the HTX-202 is very good in a high RF environment. It
: tends to not suffer from intermod interference. This might be something
: to consider, too.
:
: All in all, I'm pretty neutral on the HTX-202. I probably wouldn't buy
: one for myself, but I'm not in the market for a 2M HT, either.
:
: Contratulations on your new license and enjoy--
:

From: cbrown@thor.lostnet.org
Message-ID: <917cb$b2d5.70@news.ak.net>
Source record: 213140

Greeting all, I am looking for data on the final amp sections of an
RCA MCA38AA11B 155 mhz transciever. I am turning it into a 2 meter
amp (give a bit of a boost to the HT) and am trying to find
safe drive levels etc...

The first trasnistor in the string is a

7794-1 7803
then a
7795-1 7815
then a
7796-1 7707
and finally a pair of
7797-1 7815

Would any of you have the specs on these avail?? I have tried to find
locally
but I do not have the books and hte local library is well short on anything
electronic related.

Also there is a small pin on the bottow of the amp near the power inputs
that just runs to the circut board just to one side of the transistors. I
assume this is the bias supply, if so how many volts are needed for proper
operation? I assume bias should be applied only when the amp has input and
the output is connected to the feedl;ine via the relay. Right??

Source record: 213141

Hi,

I have had a C508A for about a month. Great HT, but careful of the limited output power - even with an external antenna on a car I have difficulty getting reliable QSOs thru repeaters. I am looking at buying a "brick" amplifier to get round this. The other restriction is the audio output is not enough for use in a moving car unless you use a headset.

Its best applications are the ones I bought it for - hill topping on climbing trips and use in hotel rooms when travelling. Sure there is no autopatch capability, but look at the size and price! The scanning capability is awesome.

Last weekend I was able to access repeaters in San Francisco on 440MHz from a 12,000 ft mountain in Yosemite National Park - about 150 miles - all on the 3 inch long antenna! Also used it in the UK a couple of weeks ago - the C-508A built-in 1750 tone capability is needed to access British repeaters.

Let me know if you need more info.

Gregory K Doerschler (gkd@wpi.WPI.EDU) wrote:

: I'd be interested in finding out whether other HTs have
: voltage/current/RF-output relationships similar to the DJ-580..

Yes, I believe this is typical of this generation of HT. The Yaesu FT530, while it can be used for a reasonable length time (~20-30 minutes) at 50% duty cycle on high power without getting too hot, exhibits the same behavior with voltage-current-power, although I don't know where the knee of the curve is. That's why I've always thought that the best way of reducing the output power in the car would be to use a plug in that could be switched back to 7.2 volts (but then it wouldn't charge the battery...).

Now, the newer radios with these MOSFET power amp modules seem to better utilize increased voltage. If you read the FT11r manual, for example, the current drain for the same 1.5 watts out is maybe 20% less with a 7.2V battery than a 4.8V battery.

>

Prior to obtaining a dual band mobile for my vehicle, I used to run my HT off the battery through a cigarette lighter receptacle (Ford calls it a POWER POINT). There were 2 problems with this. The Icom 04/AT was designed to run off a battery pack (implication: clean, no noise / ripple/ spikes/ etc.....) and as such, had virtually no power supply filtering. I had AWFUL alternator whine. Secondly, the radio would get HOT! This is not good. (Like my grasp of the obvious?) What I did was to build up a small regulator using a LM350 (or something along that line) set up for 9 Volts. This was stuck in a small aluminum mini box, and Velcro'd to the backside of the dashboard. Connection was made to a switched terminal in the fuse block. Very convienant. I picked 9 Volts to maintain adaquit worst case margin of the minimum Vin-Vout spec, assuming the vehicle was off, and the battery was a little low. I could NEVER see the point of runnig the higest available voltage to a radio to squeeze every last femtowatt out of the PA. The regulator will give you some protection from some of the vehicle's electrical nastys, and will result in extended life and reliability of the radio. Additionally, I did put a 2 amp fuse in the supply lead.

I am atempting to do the extended receive mod. on my DJ580T. I know
that you are supposed to cut the red wire, but I want to make sure
which wire you cut. With the unit's display facing up and the bottom
removed you can see a "red" loop wire that is about the same size as
the blue one, and then there is a small "orange/red" wire at the top.
I believe I cut the larger loop which is red and not the smaller loop
that is orange/red. If anyone can clear this up for me I would greatly
appreciate it. Thanks and 73.

From: wright@onramp.net (jeff wright)
Subject: Out of band RX on FT-51R

I was curious, so I called both Yaesu tech support and RT Systems (the
makers of the programming software).

Yaesu said it wasn't a "recommended mod", but that the software freq
change using the programmer shouldn't hurt the radio.

When I called RT Systems, the gentleman I spoke with said the radio was
only capable of receiving from 100-180 and 375-525 MHZ. Anything out of
those freqs would not be heard at all...

Reply direct if you have any luck with this, I am still testing it out myself.

Regards,

jeff wright

Subject: DJ580T mod question

I am atempting to do the extended receive mod. on my DJ580T. I know
that you are supposed to cut the red wire, but I want to make sure
which wire you cut. With the unit's display facing up and the bottom
removed you can see a "red" loop wire that is about the same size as
the blue one, and then there is a small "orange/red" wire at the top.
I believe I cut the larger loop which is red and not the smaller loop
that is orange/red. If anyone can clear this up for me I would greatly
appreciate it. Thanks and 73.

Subject: Need Opinions: want to operate RTTY and SSTV

Hi folks. The only digital mode I've ever worked
before is CW. Now, I want to begin some RTTY and SSTV
operation from here in Taiwan with the assistance of
one of my local ham friends. I'd be interested in
knowing the best rtty and sstv interface to get us up
and running in time for the CQWW RTTY DX contest later
this year. We already have the following:

Rig,Amp,Antenna,486 PC, 8 bit sound card. Heard we
could qrv on sstv using the sound card...is it true?
Otherwise, looking at the PASOKON SSTV card (73 Mag
last month) and have no idea what rtty controller to
buy. Thinking about a MFJ-1270. Any suggestions?

P.S. Not interested in Packet or the other dig modes,
Just good old RTTY and some SSTV.

I've had good luck with a Kenwood TH-77. My suggestions:
- Used equipment in good shape is a better deal than buying new. Buy
locally if you can. Bring a friend along. Also scan the net to
get an idea on prices.
- Make sure it can receive on both bands at once. The TH-77 can send
audio from one band to a speaker-mike, with the other to the built-in
speaker. Some so-called dual-banders can only recieve on one band
at a time.
- Just remember it's an HT, not a mobile. They generally have intermod
problems when attached to a decent antenna.

I"m about six months ahead of you getting my technician and addressed
the same issue. After talking with older and greyer HAMS, I opted for
an ICOM W-31A. My rationale:

1) A lot of my traveling is at night so I wanted a lighted keypad. This
almost forced me to the ICOM line.

2) Memories: I travel a lot to a home in New Hampshire and a workplace
in Virginia. I've my ICOM programmed for both places, as well as home
base in Owego NY. I needed a lot of memory in order to do this. The
IC W-31A has fifty memories for each band.

3) I didn't want a detachable mike/keypad as it made the keypad smaller
and I"m "fat fingered".

4) Accessories: I also purchased the cigarette lighter adapter to give
me unlimited power supply (and 5 Watt transmit as well) and a "hot rod"
antenna to help ensure that I "get through" in emergencies.

I have a 733 and I'm very happy with it. I have a dual band handheld
and I use the cross band repeater function in the 733 often. I have
it mounted in a manner similar to yours and that's why I purchased
it.

>Tom

Hi Tom, I too have tried several computer logging programs. I assume you are
interested in the casual day-to-day logging, not contest logging. For casual
daily QSO's, I've found HYPERLOG (TM) to be a superb logging program. I
believe
version 2.24 was a "testware" program that allowed free testing for a period of
time. If you like it, it can be purchased for 49.95 or something there abouts.

Features I enjoy: shows prior QSO's with a station that you've worked before,
date, time, band, etc. Shows QSO's with that country before. Automatically
tally's DXCC and WAS by band, by mode. Has default settings for power-up (I
enjoy 17 mtr CW, so it automatically comes up in that mode. Setup option

allows me to store long/lat data of my qth and shows the lp and sp and distance to the country being worked. Print function is decent. Does QSL labels.

Though it's not totally free, it is worth 50-bucks (their advertisement says "less than a hundred foot roll of RG-8 coax). Anyway, some 4000 QSO's later, I still am using the HYPERLOG software. No, I have no affiliation with Hyperlog in any way. A friend in JA introduced me to the software after trying something called DXB (did not like it). Just a pleased customer.

I don't understand why you suspect trouble in the vertical deflection system, since you described amplitude modulation, not vertical deflection, of the spot.

I would first guess that you have hum on the CRT's control grid, or earlier in the amplification chain.

And the first place I'd look for that hum is in the power supply: the electrolytic filter capacitor may have become defective in its old age.

> volts. Increasing the supply voltage beyond about 10.4 volts did
> not result in any further increase in RF output.

This is because the radio has a feedback circuit which measures the power output (actually it often measures the RF voltage output), and adjusts the RF drive to the power amplifier module to achieve the set amount. On the high power setting, the feedback loop cannot achieve this unless, obviously there is enough DC voltage to allow the amplifier to reach 5W output. The exact point where the feedback circuit starts to reduce the power depends on many factors, in this case it was 10.4 V. Probably most HT's are designed to fall close to this number, as the '5 W' NiCd pack supplies only 12.0V, not 13.8 or more that can come from a vehicle's electrical system.

> - DC CURRENT DRAIN AT EACH POWER SETTING WAS LARGELY INDEPENDENT

My tests with the power amplifier from a Motorola Mocom radio tended to show that the amount of heat produced is controled primarily by the supply voltage and not the power output. In other words, reducing the RF output by reducing the RF input to the amplifier caused the DC input current to drop, but the "excess" DC input power (DC power - RF power) remained almost constant.

This is somewhat confirmed by your numbers above:
Medium power: (0.8A * 10.4V - 1.1W) = 7.22 W excess
High power: (1.6A * 10.4V - 5W) = 11.6 W excess

At 10.4 V, the RF output can be increased by a factor of 455% while the heat produced is increased by only 160%. The disparity would be even less say in going from 2.5W to 5W.

The efficient way to reduce power output is to reduce supply voltage, not RF power input (what the feedback circuit does). So an external voltage-dropping device is a very good idea.

>The implications of this final observation should be obvious. At 10.4
>VDC, the radio is consuming 16.6 watts of input power to produce 5 watts
>RF output. At 13.8 VDC, the radio is consuming 22.1 watts input power to
>produce the same 5 watts RF output. This means that an extra 5.5 watts of
>power is being used when the supply voltage is increased from 10.4 VDC to
>13.8 VDC. Since RF output power remains constant, that extra power is
>being dissipated primarily as heat.
